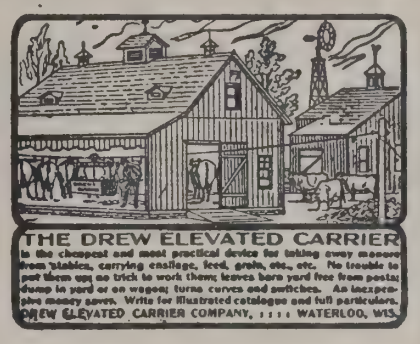
Although this experiment suggested interesting possibilities, the press of other work made it impossible to follow this matter up at that time. During the past winter, however, through the courtesy of Professor Decker, of the Dairy Department of the Ohio State University, it was made possible to continue the work. The pepsin used was a sample of Armour's 1 to 3,000 soluble scale pepsin, kindly donated by the manufacturers. The first thing done was to prepare a solution having the same coagulating power as the sample of Hansen's Rennet extract, then being used in the cheese room.

After several trials it was found a 5% solution of pepsin was practically of the strength desired. A number of duplicate cheese were made, on different days from previously well mixed milks, using the pepsin solution in one vat and Hansen's Rennet Extract in the other. Apparently the curds produced were just alike. Mr. B. B. Herrick, instructor in cheese making, and well known as a practical cheese maker of long experience, conducted the experiments and much of the credit for their successful outcome is due to him. He is very positive that no cheesemaker could have detected any difference in the curds of the two vats. Unfortunately the milk received at that time was overripe and consequently none of the cheese were fully ideal. The pepsin cheese, however, were equal to those made with rennet extract, in fact, could not be distinguished from them.

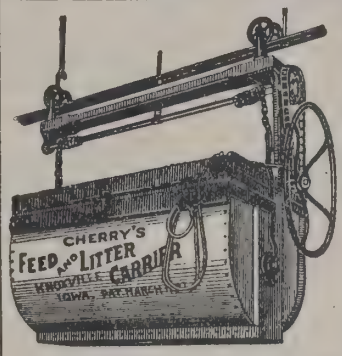
These experiments gave such conclusive evidence that a solution of commercial pepsin could be substituted for rennet extract in ceddar cheese making that it was decided to continue the study under factory conditions and Mr. Herrick was so firmly convinced of the success of the venture that he offered to carry on the work at his own factory at Wellington, Ohio, at his own risk. Early in the season, two days' run of milk, several days apart, was made up into flats and held in his curing room at about 60° F. In making this cheese a 5% solution of Armour's pepsin mentioned above was used, being added to the milk in the proportion in which rennet extract is usually used, i. e. about three fluid ounces to the thousand pounds of milk. The curds were perfectly normal and the finished cheese of excellent quality. As the local market calls for a very young cheese, about twenty of this lot were sold, when six weeks old, to Mr. Herrick's regular trade and caused no comment which indicated that there was any suspicion that they were abnormal in any respect. When asked about them one dealer said that they were unusually fine cheese. Mr. Webster of the Horr-Warner Co. pronounced them excellent and Mr. Drennen of Philadelphia, a man with some considerable knowledge of cheese, declared them "equal to the best New York make."

A full week's run of pepsin cheese has recently been completed. Several runs of a week at a time will be made at frequent intervals during the season and it is expected that before the season closes the availability of commercial pepsin for Cheddar cheese making will be established beyond peradventure. Mr. Herrick is himself so satisfied of the practicability of using pepsin, that he declares that, if he had not a large quantity of rennet extract on hand, he would be inclined to use pepsin entirely in his factory.

The only points that remain to be determined are the keeping quality of the pepsin cheese, and whether they will age with desirable flavors. All the work done so far indicates that the development of flavor will be entirely normal. Several of these cheese, however, will be held long enough to demonstrate this point, part of them being kept at ordinary temperatures and the rest placed in cold storage. As a report will be made on these at a later date, this article may be considered as a "progress report" and is offered for publication at this time with the thought, that other cheese makers may be sufficiently interested to use the method to a limited extent in their factories and report their experiences. In case anyone should desire to do so the following suggestions are made: Use only



PURE OIL MEAL. USE FOR MILCH COWS AND FATTENING STOCK.



Superior to corn, oats and hay. Ton lots $23.50; half ton $12.25; 500 pounds $6.75; 100 pounds $1.50. Put up in 100-lb. sacks f. o. b. Minneapolis. Cash with order.

This Meal is Guaranteed Absolutely Pure. We also manufacture Strictly Pure Linseed Oil.

scale pepsin of 1 to 3,000 strength and do not use any of the saccharated pepsins; dissolve one ounce of pepsin in twenty ounces of water and use this solution at the rate at which you are using commercial rennet extract, handling the cheese in the ordinary way; do not make up more of the solution at one time than can be used in three or four days—rather have it fresh, although the pepsin seems to be more active after a few hours than when first dissolved.

This question naturally suggests itself: Does the use of pepsin offer any advantage over rennet extract? There is practically no difference in the first cost at the present price of pepsin, though something might be saved in freight as one pound of pepsin will make two and one-half gallons of solution. At the present time, however, only a very insignificant part of the material available is used in making pepsin—the demand being somewhat limited and it is possible that it could be produced at a much lower cost if made in larger quantities. For the present the question of cost does not enter into the discussion. There are, however, one or two points in favor of the use of pepsin.

Rennet extracts are variable in strength. One well known cheese maker told the writer that it always took him some time to become accustomed to each new lot of rennet. The scale pepsins put on the market by reliable manufacturers to meet the requirements of the U. S. Pharmacopoeia (the so-called 1 to 3,000 pepsin) have proved fairly constant in strength. Again, rennet extracts deteriorate rapidly, especially in warm weather, while pepsin being in a dry form can be kept for a long time without injury. Rennet extracts often contain large numbers of bacteria and molds, while pepsin can be obtained approximately sterile. On the whole this use of pepsin seems to be of sufficient promise to justify a somewhat extended trial.

As noted above, these experiments add nothing to our knowledge of the number of enzymes present in the stomach, as the methods used in the preparation of both pepsin and rennet would tend to extract all enzymes present. They do, nevertheless, establish the fact that the stomach of the pig is as practical a source of coagulating material as that of the calf. It may be well to state here, that in a recent letter received from Armour & Company, in answer to some questions concerning the samples of pepsin used in these experiments, the statement is made that nothing but the linings of pigs' stomachs is used in the manufacture of their scale pepsin.

Sugar Beet Pulp for Dairy Cows.

Bad Economy to Buy and Haul Any Bulky Food.—What Succulence Is and Is Not.

It is a well known fact that sellers and promoters of by-product foods always claim some mysterious value for their food not found by the chemist—a given percentage of protein and carbohydrates in New York State, they have to acknowledge. They assert that their particular food has a power to greatly assist assimilation of other foods.

My belief and understanding of the effect, source and value of succulence are about like this: In the first place, total solid digestible matter, properly balanced, is the basis of stock feeding. The animal cannot digest what it does not receive. When we, therefore, add succulence at the expense of digestible food nutrients, we are simply, in plain English, starving the animal, nothing more, nothing less. On the other hand, both for milk production and the building of an edible carcass, a small quantity at least of some succulent food must be given for the highest continued production.

What is succulence? Any food in which the natural juices are still held, either by cutting from a growing field or preservation in some form—ensiloing or storing roots. Drying a food and then mixing it again with water does not give succulence. In fact, it is my opinion that water added to any dry food is a positive damage, unless it is dusty hay for horses, and then it is given for a physiological effect, from the fact that less saliva is secreted during mastication.

Now in regard to beet pulp: Cornell Experiment Station found that it had, by weight, one-half the value of corn silage. Silage can be produced from a minimum of $1 50 to a maximum of $3 a ton, ready to feed from the pit. We are therefore safe in saying that beet pulp is worth, delivered at the feeding barn, from 75 cents to $1.50 a ton. I have had intercourse with many practical feeders, near to and far from the sugar beet factories in New York State, where they have paid from 75 cents to $1 a ton at the factory, and all the way from $1 to $3 freight, besides the handling and hauling from the railroad station, which would, of course, vary widely. It costs, by the way, more to haul and handle a ton of beet pulp, worth not to exceed $1.50, than a ton of cottonseed, worth more than $30.

I live three and one-half miles from a railroad station. Our teams will, as a rule, haul from four to five tons of stuff a day between milkings, morning and night.

The net cost of hauling a ton would, therefore, be not less than 60 cents nor perhaps more than 75 cents. The same rate for hauling food nutrients in the more highly concentrated food stuffs would be from $5.50 to $6.50 a ton. At this rate the item of hauling alone would therefore take away all the profit one might expect from feeding any food. Very few farmers have continued to feed the stuff, so far as I am aware, who were obliged to pay for any transportation charges.

If the feeding can be carried on at the factory and the labor of handling be minimized, pulp can no doubt be fed as a part ration.

There is a fault usually found, however, when large quantities of so-called cheap, bulky food are at hand, to overfeed. The animal is thereby forced to take too much bulk to get the required quantity of food. Filling a cow full and feeding her may be diametrically opposite propositions. From the point of view of an eastern cow feeder and milk producer, there is one fundamental principle that should always be kept in mind if foods are used not grown upon the farm—buy only the highest concentrates, keeping in mind, of course, the cost of the food nutrients contained and the requirements of the animal in order to balance the home grown stuffs. Produce and feed from the farm are of the succulent and coarse, bulky foods, which should constitute about two-thirds of the total food consumed.

To illustrate from present feeding: As I write (May 25) we are experiencing a severe drouth, and pastures are very short. To maintain milk flow grain must be fed.

It is a question, therefore, what foods will furnish the most digestible protein and carbohydrates for the least money. Here are some of the figures, putting a price of 3 cents a pound upon digestible protein and 1 cent a pound upon digestible carbohydrates:

Mixture of one-half ton cottonseed meal and one and one half tons corn meal; total cost at our railroad station, $33 for the corn and $15 for the cottonseed=$48.

The cottonseed contains 372 lbs. protein at 3 cents	$11 16
The cottonseed contains 444 lb. carbohydrates at 1 cent	4 44
The cornmeal contains 237 lb. protein at 3 cents	7 11
The cornmeal contains 2,292 lb. carbohydrates at 1 cent	22 92
Feeding value of two tons	$45 63
Cost over feeding value, $2 37	

Mixture of one-half ton linseed meal and one and one-half tons red dog or low grade flour. Total cost of mixture: Red dog, $34.50; linseed, $14.50=$49.

The linseed meal contains 293 lb. protein at 3 cents	$8 79
The linseed meal contains 485 lb. carbohydrates at 1 cent	4 85
The red dog contains 405 lb. protein at 3 cent	12 15
The red dog contains 1,974 lb. carbohydrates at 1 cent	19 74
Feeding value of two tons	$45 53
Cost over feeding value, $3 47.	

Two tons bran contain 488 lb. protein at 3 cents	$14 64
Two tons bran contain 906 lb carbohydrates at 1 cent	9 06
Feeding value	$23 70
Cost of two tons, $40; cost over feeding value, $16 30.	
Two tons middlings contain 512 lb. protein at 3 cents	$15 36
Two tons middlings contain 1 214 lb. carbohydrates at 1 cent	12 14
Feeding value	$27 50
Cost of two tons, $43; cost over feeding value, $15 50.	

I am, therefore, feeding the corn and cottonseed to milch cows, and the red dog or low grade flour and linseed meal to all young calves and hogs.

The cows are eating grass, which makes this food ideal, both from a physiological and pecuniary standpoint. The red dog and linseed are fed with whey, and so the combination is again ideal. The results in milk and growth are in harmony with the figures.

When it is necessary to increase the bulk and ash content, which it will be later in the season, I shall then put into the two tons mentioned a ton of bran, and all will again be complete.

I have departed from a discussion of the beet pulp question, but it was only to give a practical illustration of the proposition to buy highly concentrated foods. I could, if space permitted, make many other combinations that would arrive at the same conclusion. It does not pay to haul, handle and ship water.—H. E. COOK in New York *Tribune Farmer*.

The Value of Barnyard Manure.

The Ohio Station has recently issued a bulletin dealing with the important question of the preservation and proper use of barnyard manure. The experiments on this subject were made on rotations of corn, oats and wheat followed for two years by clover and timothy mixed, and on corn, oats, and wheat grown continuously. "In these experiments manure "taken from flat, open yards, where it had accumulated for several months during the fall and winter, and had been subjected to the conditions which affect the ordinary open-yard manure of the average Ohio farm, conditions which involve very considerable losses," was compared with manure treated as follows:

A lot of manure, taken from an open yard, where it had accumulated during the winter from daily cleaning out of the stable behind a herd of dairy cows, which had been liberally fed on bran, gluten meal, corn meal, hay and silage, was divided in the spring into four parcels. On one parcel the finely ground phosphatic rock, from which acid phosphate is made by treating with sulphuric acid, and which, in its untreated condition, is known in the south as "floats" was dusted as the manure was thrown into a pile; on a second parcel acid phosphate was dusted; on another the crude potash salt known as kainit, and on another, land plaster, or gypsum, these materials all being used at the uniform rate of two pounds per 100 pounds of manure, or 40 pounds per ton. At the same time a lot of manure was taken from box stalls, where it had accumulated under the feet of animals, which were kept continuously in their stalls, being given sufficient bedding to keep them

CATTLE COMFORT
KEEPS FLIES OFF CATTLE.
A RELIABLE ARTICLE
Keeps Cows, Horses, etc. comfortable in fly time. Sold by Seedmen and Merchants. For pamphlets write
HAMMOND'S SLUG SHOT WORKS
FISHKILL-ON-HUDSON, N. Y.

Rippley's Fly Remover

instantly removes all flies, mosquitos, lice and other insects from cattle, horses and other animals sprayed with it. It is healing to any sore. Animals rest easy and feed quietly all day. Cows give ¼ more milk, which is a big saving. 1 gal. will protect 500 cows. Endorsed by the best class of people. Order at once and secure agency, you can sell hundreds of gallons. 1 gal., $1.10; 2 gal., $2.10; 5 gal., $4.50; 10 gal., $9.00. RIPPLEY'S Special Sprayer for applying same, 65c; 4 gal. Compressed Air Sprayer for applying same on large herds, $5.00; 5 gal., 5.50. Money refunded if not as represented. Our Breeders' Supply catalog mailed free; tells how $8.00 per head can be saved by using Fly Remover; ½ bbl. lots of 30 gal., $25; freight paid on 20 or 30 gal. lots.
Gentlemen:—For three years I have been experimenting with different things to keep flies off my cows, but not until I tried your Fly Remover and Compressed Air Sprayer was I successful. I used this last year and found that it costs less than one cent per week per cow. With your Compressed Air Sprayer it takes but a few minutes to put it on, and the result has been that my cows were free from flies, and during the year gave 6400 pounds of milk each, which made 324 pounds of butter per cow. I can heartily recommend it to all stock owners.—JOHN ARMSTRONG, President State Board of Agriculture, De Smet, S. D., June 4, 1901.
RIPPLEY HARDWARE CO., Box 20, GRAFTON, ILL.

YORKSHIRES.
The Large, Improved Yorkshire is by all odds the best white hog on the market today. Prolific, easy keeping, with desired size lacking in Small York. Young stock for sale.
E. E. STEVENS,
R. F. D., North Madison, Lake Co., Ohio.

BERKSHIRES. We are breeding Imported boars on Gentry's great Duchess sows, weighing 600 pounds. Our herd is very select, every animal a gem. All our choice pigs of 1902 farrowing have been sold. We are now taking orders for 1903 farrowing.
JOHN WHITE & SON, Adamstown, Md.

NOW IS THE TIME TO SUBSCRIBE FOR Hoard's Dairyman.

clean without cleaning out the stalls, and similarly treated.

For corn and wheat the manure was applied as a top-dressing, being put on with a manure spreader at rates of 4 and 8 tons per acre on each crop in the rotation, and 2½ to 5 tons in the case of the continuous cropping. The results of the experiments, as measured by the crop yields, show—

That it will pay well to give more attention than is done on the average farm to the preservation of barnyard manure, first, by guarding it from the sources of loss which occur in the ordinary open barnyard, and, second, by treating it with materials calculated to reduce the losses from escaping ammonia on the one hand, and to increase its content of phosphoric acid on the other.

To accomplish this purpose, acid phosphate appears to be the material producing the largest and most profitable immediate increase in effectiveness of the manure, but the experiments strongly suggest the possibility that the finely ground phosphatic rock from which acid phosphate is made, may be found an economical substitute for the latter, by using it as an absorbent in the stables and thus securing an intimate mixture with the manure in its fresh condition.

The yields were uniformly larger and the increase due to the addition of the preservatives smaller in case of the stall manure than in case of the open-yard manure, thus showing that either with or without the addition of preservatives stall manure suffers less loss and is richer in fertilizing constituents than open-yard manure.

CONCERNING OUR ADVERTISERS.

THE BUSINESS EYE.

It requires a business eye to see an opportunity when it presents itself. The ability to see things as they are is the one thing which agriculturists should possess if they mean to make a success out of whatever they undertake to do. It is the power of discernment that enables them to keep up interest in their work, and it is enthusiastic interest in what one is doing that gives life its zest and enables one to do his best. In the purchase of a binder, for example, a good business eye is needed. There are many details in the construction of the machine that should be carefully examined; and where this is done the farmer in the great majority of instances buys the McCormick, because it is pre-eminently the machine for the man with an eye for business.

The 1903 Plano Husker and Shredder catalogue is one of the most attractive machine catalogues yet issued. The handsome cover is printed and embossed in yellow, blue and gold with a full sized ear of corn in natural colors. The di criptive matter is clear and to the point. The Plano Husker must certainly be one that will stand close investigation, for its entire mechanism is clearly and interestingly described and illustrated in this book so that anyone can see just how it works although the machine has several novel features. The hearty endorsement of practical fieldmen who are using Plano Huskers is in evidence on every page of the book and makes it unusually convincing. The modern husker and shredder is proving to be one of the most profitable machines ever placed within the farmer's reach, and we believe it will repay all our readers to send for a copy of this catalogue for the practical information it contains. A copy will be sent free to any reader of this paper by addressing Plano Division, International Harvester Company of America, Chicago, or any Plano Branch House.

SCALING THE FARM EXPENSES.

A good scale on the farm is just as essential as a plow or a harrow. There is so large a waste of profit in the outgoing and incoming products that a good scale will save more than enough in a single season to pay for itself. The selection of the right scale is a good deal like the selection of the right horse. The vital parts of a scale are hidden, and anyway, what farmer can tell the difference between a hardened steel balance pivot and one made of soft iron? Yet, right here is the difference between a good scale and a guessing machine. Write the Osgood Scale Co. 91 Central Street, Binghampton, N. Y., for their catalogue.

We publish in this number an item that should have the careful consideration of every reader, young and old. Habits of economy, a careful judicious spending of every cent of one's income, thrift and saving should be cultivated by all. The young should be trained in the proper spending of money so that they may acquire the habit of making each dollar go the farthest possible. "A penny saved is a penny earned" is a wise maxium, and should be before the young, often. The old, too, will find it beneficial to be reminded of this old adage, to have their attention called to the duty of careful expenditures. In another column will be found an advertisement that briefly calls attention to an institution that has done more to help the thrifty, saving buyers of the country than any other. The lines illustrated are so varied that everyone should be interested. Every statement made is genuine, and backed by the well known reputation for honesty and fair dealing of the old and tried house of H. R. Eagle & Co., of Chicago.

HOGS AND HOG CHOLERA.

Breeders dread hog cholera more than any other plague of the pen, because they know it to be their greatest enemy. The various state experiment stations and the largest breeders have devoted much time and money to the discovery of the best and surest method of dealing with this pest and the consensus of opinion is that Chloro-Naptholeum Dip is the safest and most reliable preparation that can be had and that if it is used in time and systematically and regularly as a wash for hogs and a disinfectant in their pens it is the best safeguard. That this preparation has saved hundreds of thousands of dollars to stock raisers in general and hog breeders in particular is fully attested by these facts. This preparation is the product of the chemical laboratory of the West Disinfecting Co., Inc., 22 E. 59th street, New York, who will forward their free books on the treatment of parasitic and skin diseases of Swine, Cattle, Sheep, Horses and Poultry to such of our readers as write them. The book is really a "guide to wealth." It will be well to mention the kind of stock in which you are most interested to get the right books for your information.

For the land's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Bloating.

My neighbor lost a valuable cow yesterday on alfalfa pasture. His cows had been running on rye pasture all spring and a week ago he turned them on alfalfa several hours a day with no bad effects. Yesterday, one of them bloated so bad that it died in less than one hour. Where is the proper place to insert trocar. Is it safe to cut alfalfa and feed to horses in the stable, or is it better to let it wilt well first? WM. W. C.
Grafton, Wis.

ANSWER.

Every dairyman should supply himself with a trocar and cannula, as when the cows begin to bloat there is not time enough to call a veterinarian. Insert the instrument at a point equally distant from the last rib, the hip bone and the transverse process of the lumbar vertebrae on the left side. The trocar is withdrawn after both have been properly inserted, and the cannula left in place as long as any gasses escape. One ounce each of powdered ginger and hyposulphite of soda may be given in a little warm water after bloating.

(The office Editor is of the opinion that limited amounts of alfalfa fresh from the field, if not wet with dew or rain, could be safely fed to horses, but he is without experience, and therefore cannot advise with certainty.)

Weak in Limbs.

My calf was all right in the morning and was just able to get up on her feet, but the next day she was not and has not been on her feet since, that is about a week; the calf eats and drinks but can't get on her feet. When she tries to get up her hind legs spread out. P. W. B.
Newbury, N. Y.

ANSWER.

Induce the calf to stand as much as possible so that she may regain her strength. While standing, rub the back and legs with alcohol, freely.

Breeding Cows.

How often should a cow be served when she comes in heat. Some cows come to my bull and after they are served they throw off considerable slime and are sure to come in heat the second and third time and fail to get with calf. D. H.
Ritchley, Mo.

ANSWER.

As a rule one leap is sufficient; no matter if she does discharge a greater part of it, there is enough left to answer the purpose if the cow is in good breeding condition.

Above trade mark on every box.

Cure For Galls

While you work the horse.

It's BICKMORE'S

Dealers selling it everywhere are authorized to refund money if it fails to cure all Galls, Scratches, Cracks, Wire Cuts, etc. The standard horse remedy for many years. Sample 10c.

"Just as good?" "Just as good!" Did you say? "Just as good as Veterinary Pixine!!" The dealer who tells you that is mistaken. He does not know

FACTS AND TESTS PROVE IT!

Emery, Ky., April 9, 1903.

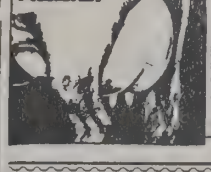
I feel it my duty to tell what Veterinary Pixine did for a horse of mine. He was cut with a knife between the fore legs three inches deep and two inches long, which every minute would gap open. I used several different kinds of remedy without success, even to having some stitches taken. Nothing did any good and it kept swelling and became feverish. I almost gave up hopes of getting him well. In the columns of the Ohio Farmer I observed your advertisement and, as it was the last chance, I purchased a box at the druggists and used it as directed and before the box was used up the cut was entirely well. I intend to keep a supply on hand for emergency cases if I have to pay a dollar a box for it. Please accept my thanks for the good I have received from its use, and if you choose you can use my name and testimony.

W. S. CAMPBELL.

This penetrating, stimulating, soothing, absorbing, antiseptic, healing ointment heals from beneath the surface by disinfecting the parts, subduing inflammation and stimulating healthy granulations, not by drying and scabbing, and stimulates growth of hair, natural color. Makes quick, clean and healthy cure; heals stinging, burning, chronic saddle and collar galls, hopple chafes, abscesses, caked bag, cow pox, and hoof rot. It penetrates, stimulates, soothes and heals while horse works. Money refunded if it fails.

Price, 2-oz. box 25c; 8-oz. box 50c; 5-lb. pkg. $4.00, at all druggists and dealers or sent prepaid.

TROY CHEMICAL CO., Troy, N. Y.



Also Manufacturers of "Save-the-Horse" Spavin Cure. $5.00 a bottle. Send for copy of guarantee and booklet.

Your Horse can work without pain while his sore breast is healing if you use MOORE BROTHERS'

GALL POWDER

the most effective cure ever known for healing sore shoulders, backs and other skin abrasions; at druggists, or by mail $1.00. MOORE BROTHERS, Veterinary Surgeons, Albany, N.Y. "Facts for Farmers and Breeders," sent free.

COWS RELIEF

Expels the terror of caked bag, the annoyance of sore teats and dread of hard milkers.

Used Exclusively at Model Dairy

Guaranteed to cure caked bag in 12 to 24 hours. Invest 50c and save a cow. Makes milking easy for man and cow. Price, ½ lb 50c, 1½ lb $1.00, postpaid.

Cheese as a Food.

What more important questions can occupy our attention than those relating to human food. The advancement and development of the race depends primarily upon its aliment. And as man is the ultimate of all earthly creation, his food should consist of the best elements in earthly production. In vegetables we find all the elements composing the bodies of animals, but in a lower state of organization. The cow eats grass and finds in it all the elements necessary to build up and support her own system, and these she concentrates and elaborates into a higher form of food for man.

The muscles, nerves, and brain power of man must be supported by nitrogenous food, and the more concentrated this food is the greater the muscular power will be, the more sensitive the nerves and the keener the intellect. Shakespeare understood this when he made Cassius say:

Now in the name of all the gods at once
Upon what meat does this our Ceasar feed,
That he has grown so great.

The more we progress in chemical knowledge the better we understand digestion and nutrition, hence the "balanced ration" which is as necessary for man as for the lower animals. It then becomes of great importance that we should understand the elements of the food we use, and learn to so combine these as to produce the highest development of health and strength. Hygienic writers take milk as the best standard for human food. Cheese is concentrated milk; all the elements save the sugar are retained which is easily supplied by other food. The history of cheese dates way back in ancient times. We find Job referring to it thus:

Hast thou not poured me out as milk,
And curdled me as cheese?

Cheese was a common article of food among the Greeks and Romans, and Homer celebrated its virtues in the feasts of those times, thus:

There thrice within the year the flocks produce,
Nor master there, nor shepherd ever feels
The dearth of cheese, of flesh or of sweet milk
Delicious drawn from udders never dry.

It is not enough to know that food is agreeable to the palate and easily digestible, but what are its constituents and what part of the system it builds up. The human system being complex in its elements, its food must likewise be complex and various. The young receive in the form of casein (cheese) the chief constituents of the mother's blood. When chemically examined, casein is found to contain a much larger proportion of the earth of bones than does blood, and that in a very soluble form capable of reaching every part of the body.

If milk is the standard of human food, cheese, its important product, must be healthful, unless it shall have changed its elements or condition in the process of manufacture. Therefore, a cheese to have its greatest nutritive value must be properly made, well ripened and carried on to that easily digestible stage by the agent rennet. A pound of such cheese is said to be equal in value to beef-steak, pound for pound, as eighteen and one-half is to ten.

As cheese contains all the elements of milk except the sugar, this does not render it less healthful or digestible, but only deprives it of this supporter of heat and respiration, which is easily supplied in other foods, such as bread, potatoes, and other vegetables. The fat adds to the digestibility of cheese, hence whole milk cheese is more easily digested than skim milk cheese. The best proof of its healthfulness is found in the fact of its use among all civilized people. The long experience of the English, Scotch and Irish laborer proves cheese to be the most wholesome as well as nutritious food. A small quantity of cheese with them takes the place of a larger quantity of meat, and enables them to endure such hard labor as the American thinks he can only perform upon a generous meat diet. In Germany the farm laborer depends largely upon skim milk cheese as food. The American Encyclopedia says:

"The peasants of some parts of Switzerland, who seldom ever taste anything but bread, cheese and butter, are a very vigorous people."

Americans, generally speaking, eat too little nitrogenous food, owing perhaps to their predilection for the finest flour and much pastry, especially pie. Women are not such flesh eaters as men, and with their love of sweetmeats the nervous system becomes illy nourished; these sweetmeats are nearly all starch and sugar. If they would make cheese a more constant article of diet and use more unbolted flour, with more open-air exercise, they would soon become the most healthful and robust, as they are now said to be the most beautiful women in the world. Cheese is less liable to putrefactive changes than flesh and thus much less likely to develop in the human system those scrofulous diseases attributed to animal food.

Thus, in summing up, it appears evident that the casein of milk is a highly important alimentary principle and proves equally healthful and invigorating whether taken in the liquid state of milk, or in the concentrated form of cheese. Although the American people are more favorably situated for the production of cheese, more especially in the northwestern part of the Union, we have not learned to use it as a daily diet. I think one reason is, we eat our cheese too soon after making, and do not give it time to ripen properly. Such cheese is hard to digest and really not fit to eat. If we examine the question of economy in reference to the comparative prices in market we find that retail prices of cheese range from sixteen to twenty-two cents per pound, about the same as beef, showing cheese to be about half as much as beef, according to its real value. If we compare it with pork, or mutton, or fish, we shall find it the cheapest food. There is very little waste in cheese, while beef is one-eighth bone. It also has the advantage of requiring no cooking, and in the warm season saves the poor the expense of fire. Of all forms of animal food it is undoubtedly the most economical.

The dairyman who would produce cheese will not have to look for a foreign market for some time, as the per capita consumption of cheese in the United States is only three pounds while butter is about twenty pounds per capita. Therefore, if he will manufacture the best quality of cheese he will find a good demand for it, and let us hope the American people will soon become a greater consumer of this most nutritious food, cheese.—W.W. GRANT in the *Industrialist.*

Raising Fodder Corn.

The following directions for raising fodder corn are given by Prof. Haecker of the Minnesota Experiment Station, and are particularly applicable at the present time, when the untoward season in various parts of the country has prevented the planting and sowing of ordinary crops:

"For growing fodder corn, harrow once a week until about June 15, then sow the corn with an ordinary wheat drill, leaving two shoes open and closing five, then two open and five closed, two more open and the rest closed, when three double rows are planted at once. The double rows will be about 44 inches apart, and the two drills in the row about six inches apart. It requires about a bushel of seed to the acre. Use common homegrown dent corn for seed, or other good dent variety, but not the large Southern or flint. Harrow once more before corn is up, and once when it is two or three inches high; then cultivate once between the rows. The late planting is preferable because it affords an opportunity to kill most of the weeds before planting, and by June 15 the soil is warm, and the corn will grow so rapidly that the weeds are choked down and the field will be clean when the crop is harvested. Thick planting is recommended because it produces much more feed per acre than if planted in hills, and because it prevents the developing of ears, which is objectionable, since it is better for the nutrients to be left in the stalks and leaves than to be transferred to an ear, where there is less obtainable nutriment. It also saves husking, shelling and grinding of the grain, and if planted thickly, the whole stalk is consumed."

Although Prof. Haecker mentions June 15th as the proper time for planting fodder corn, there is every reason to believe that it may be planted with profit even so late as July 1st. Our readers in the Eastern States, where they have suffered so severely from droughts, might well try planting more or less of this fodder corn to furnish them with roughage for the ensuing winter when there is likely to be such a dearth of hay. Although Prof. Haecker does not advise using flint corn for this purpose, his reasons are simply that the amount per acre will be less than when the dent varieties are used, but we know from experience, that very satisfactory results can be had from flint corn.

Special Offer of Fine Dairy Farm

ADJOINING RED WING, MINNESOTA.

174 ACRES—140 under high cultivation, balance good pasture and woodland. Has complete machinery for Dairy, with power, etc., and all machinery for cutting corn. Two large silos, sufficient to hold feed for 50 cows, and large barn to tie up 70 head. One new house—could not be built for less than $2,500; another good house for help. Large horse barn and granary. Improvements could not be duplicated for less than $7,500. Monthly receipts over $600. All for sale at $12,000.

H. A. CAMPBELL, 107 E. 4th St., St. Paul, Minn.

DO YOU WANT A HOME

in Central Wisconsin? We offer very desirable lands to actual settlers. Our lands are in Marathon County and are some of the very best hardwood, agricultural and dairy lands in the state. Deep clay loam soil. Good water easily obtainable at but little depth. Country opened with good roads and well populated.

Schools, both public and parochial, churches, general stores, bank, creamery, etc., within easy reach. Ready market for farm and forest products.

Terms reasonable. If you desire to improve your condition write for further particulars to

RIETBROCK LAND & LUMBER CO., ATHENS, WIS.

FOR SALE MY DAIRY FARM 198 acres, 1½ miles west of University. Would sell farm with or without stock. Write for detail description, **G. B. M.,** P. O. Box 144, Charlottesville, Va.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

HERE IS YOUR CHANCE!

For an "up-to-date" responsible dairyman, to rent, for term of years, a very desirable Ranch and 125 head milch cows, in one of the choicest dairy sections of California. No snow, nor yet excessive heat. Green grass the entire year. No winter feeding necessary. Freights reasonable. Apply to G. H. KELLOGG, 330 Pine St., San Francisco, Cali.

Give Us YOUR ADDRESS On a Postal

It would please us to tell you about our lands. We can convince you that our lands are well selected bargains. Virgin soil, plenty of water, fine crops of hay, grain and vegatables.

Sold on easy terms to suit purchaser. Special railway rates to anybody desiring to look at them. We would like to take the matter up with you. Write us and find out what we have to offer. We own the lands and selected them personally.

WILSON LANE, Janesville, Wis.

Room for Improvement in Cheese.

Our sister state, Minnesota, not content with her standing as a butter state, is determined to challenge Wisconsin, New York and Canada in the matter of producing cheese of the highest quality. Following is the paper read by J. Lehnerr before the Cheese Makers' Educational Convention in that state, and it contains matter that deserves reading and consideration in every cheese making community:

We can make just as good a cheese in the state of Minnesota, as they do in any other state in the Union. All we need is the production of a good, clean-flavored, unadulterated milk.

How can we improve the quality of our cheese?

There are people living to-day who believe that our cheese factories are O. K., that is, good enough, and that there is no need of getting alarmed and using big cross marks on this subject. Yes, there are people who believe in leaving well enough alone; who never want to go to any extra trouble and expense in order to try to improve their methods and old ways of doing things. They say this talk of keeping up with the times is a new-fangled notion, and time costs money for those who try it; in fact, we are often told that those who stick to the "good, old-fashioned ways" and do not have much to do with these up-to-date things are the most successful and make the most money.

I, for one, look at it in another light and think if we want to make any progress and want to improve the quality of our cheese, we must not feel satisfied with our present standard or degree of perfection, and think we are all right. The moment we do this we are at a standstill, and that means that we are going backwards; and those who are progressive and up-to-date will improve and advance, and we will be pushed aside to see the great progression of the onward, moving, up-to-date passer-by.

Another thing we probably should do more, but can not very well, and that is to reject all milk which has not been thoroughly cooled or aerated, or contains any dirt or smell whatever. But if this were done, the cheesemaker would be apt to have a pretty lively time and considerable trouble. Personally, I have tried to follow this rule to some extent, but found it impossible; as our patrons do not practice aerating their milk and can not detect anything wrong with the milk, even if it is slightly tainted; therefore, would think a wrong had been done. So we are simply obliged to accept milk which we do not care to, and lots of it, too, just to keep peace and prevent trouble.

But now we come to the point: Nobody, I do not care who it is, can make a very high grade of cheese out of tainted or imperfect milk. Every patron that allows his cows to remain dirty, covered with a thick coating of manure, never takes a brush and cleans the cows, and there are plenty of them, is surely not in favor of improving the quality of cheese. They claim they can do clean milking even though the cows be dirty. I do not take much stock in this theory. Milk, cheese and butter are articles of food to be eaten by men, women and children; a great many forget this. They seem to think that it does not make any difference what kind of milk is sent to the factory, judging from what may be seen on the strainers of factories, and I believe if the dirt which falls into a milk pail could be separated, placed on a plate for food for such a milker, he would change his mind, and I do not know but it would be a very good medicine for the man. If the cow is clean and your hands and pails are also clean, there is every reason to believe the milk will also be clean. On the other hand, if the can is dirty and the milker is filthy, the milk is bound to be tainted. In the summer, cows wander over dirty sloughs and the udders become dirty. The udder should be washed at every milking and unless this is done, bad milk comes to the factory. Many claim that it does not pay to brush the cows, wash udders, feed balanced rations, aerating and cooling milk. Men who make this claim are invariably the ones who never try it and their opinions are worthless. Can anybody tell me how much they have lost in taking good care of their cows and doing the other things mentioned? I say, take your hat off when you meet a good cow.

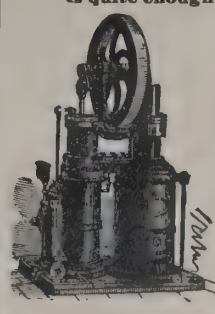
When you cultivate, prepare and care for a field properly, you will get larger crops and better results than by little or no care and cultivation. This is an established fact that none can dispute. The same principle holds true in the dairy department of the farm as well as in the crop department. If there is not money enough in our cheese business to warrant our doing the right work I say quit the business. Do not bother with it unless you can do it as it should be done. Remember the old saying. Whatever you do, do well.

A little more about taking care of the milk. I will say:—After the milk is drawn from the cow, milk should be properly aerated and cooled. Filth on the cow's udder carries a great many bacteria into the milk. Germs in milk multiply very rapidly unless the milk is aerated and cooled immediately after it is drawn from the cow. This should be done outside of the stable. Cooling milk arrests the growth of germs. The sanitary condition of milk is very important. Milk has frequently caused the spreading of germ diseases, such as scarlet fever, diphtheria and typhoid fever. The purity of the water supply and the condition of the stables are the two most important factors for the production of good milk. A cow's stable is a place for a cow to live in, not to exist in. The health of men and women depends, to a large extent, upon the cow, the health of the cow depends largely on her house being properly aired and cleaned; therefore, the health of children and men depends in a great measure on how the cow's stable is looked after.

Neither cattle nor other animals should be allowed or compelled to drink stagnant water. In fact, no animal should be given water to drink which we would hesitate about drinking ourselves.

Some causes of bad flavored milk are weeds, such as Swede turnips and tops, rape, musty meal, raw potatoes, grass having bad smelling weeds, such as leeks or rag-weed.

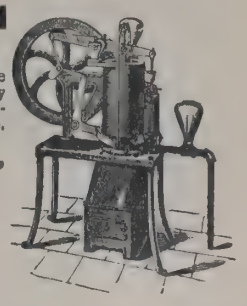
If you have some old and rusty cans, leak badly and have dinged covers and spill one-half a gallon or more of milk every day they are sent to the factory, should you continue to use them? Will it not pay to buy new ones?



Where possible, insist on the whey being returned in the milk cans. Let it stand in the cans until just before commencing to milk, then, empty, rinse very slightly with warm—not hot water. Put the evening's milk at once into this can without straining and aerating. If it gets to the factory before it sours, step into the factory about noon and hear the cheesemaker give an exhortation on gassy curds and whey flavors. Observe the look on his face, which says, "If I get through by 8 or 9 o'clock I'll do pretty well." Come around again in about three weeks and see the buyer look at the cheese made from the vat into which but one can of such milk was emptied and notice him set this cheese aside for further inspection or a lower price. He may refuse it altogether. It will do for the home market and will have a great tendency to develop home consumption.

To wash milk pails, milk cans, etc., they should first be rinsed in luke warm water, next washed with hot water and then scalded, after which put them in a nice place to air and dry. Do not wipe dairy tinware with a dishcloth. Make a bonfire of all the old dishcloths that are used for wiping dairy utensils and the flavor of the milk will go up 10 per cent.

Now we come to the weigh room. There is the good chance to make the good or the poor cheese. It is the duty of the cheesmaker to inspect carefully the milk and milk cans and can covers, take out samples of milk of both morning and



HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If

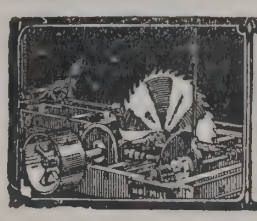
SAVES ITS COST ON THE FIRST CROP.

It spreads all kinds of manure, lime, salt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.

Do you know of any other piece of machinery for use on the farm of which this can be truly said?

The Improved Kemp Manure Spreader

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new **Beater-Freeing Device, Apron-Returning Device** and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about **"How to Grow Big Crops."** Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court. KEMP & BURPEE MFG. CO., BOX 48, SYRACUSE, N. Y.



Made for the Man Who Wants the Best.

The Endless Apron Great Western Manure Spreader.

SPREADS and pulverizes all kinds of manure, fresh, well rotted, mixed, full of straw or cornstalks, sheep manure. No matter how tough, we guarantee our spreader to spread it so evenly that one load will do more good than three spread by hand. **Endless Apron** is always ready to load. **No turning back** after each load is spread. **Front wheels** cut under and machine can be turned in its own length. REGULATED motion to spread thick or thin. Our **non-bunchable rake** holds all large chunks on top of beater until they are **thoroughly pulverized. Combined Hood and End Gate** keeps manure away from beater while loading and acts as wind hood in spreading. LIGHTEST DRAFT ever produced on a manure spreader, because front and rear wheels track and the load is nearly equally balanced on front and rear axles which brings load up close to horses. **Send for free illustrated catalogue** giving full description and how to apply manure to secure best results. **Saves time, labor, money.**

WEST DISINFECTING CO., Inc., 8 E. 59th St., New York.

What Prof. J. H. Sheppard Says About Zenoleum Dip:

The favor which Zenoleum has among stockmen is consistent evidence of its merit.

January 28, 1903. J. H. SHEPPARD, Prof. of Agriculture, Agricultural College, North Dakota.

Send for copies of "Zenoleum Veterinary Advisor" and "Piggie's Troubles" and see what others say about it. Books mailed free. Sample gallon of Zenoleum $1.50, express prepaid.

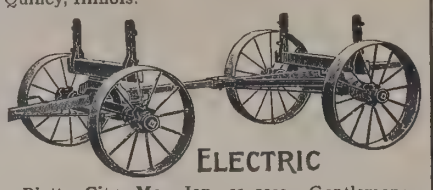
"The Great Coal Tar Carbolic Dip." ZENNER DISINFECTANT CO., 34 BATES STREET, DETROIT, MICHIGAN. Five gallons $6.25, freight prepaid.

evening milk, make your test every two weeks, invite farmers to be present, if possible, when you make the test. It is the duty of the cheesemaker to examine daily the inside and outside of the opening from the weighing can into the milk conductor, and offensive matter appearing yellow, when not with milk, is most dangerous to the flavor and keeping qualities of cheese. He should be thoroughly qualified as to teaching the farmers improved methods of handling stock, feeding stock, general farming and to answer questions asked by farmers about the weigh room.

Seeding to Grass.

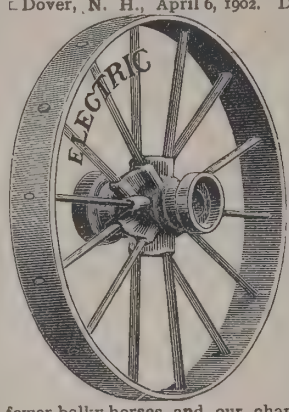
The *Ohio Farmer* gives the following advice on seeding down to grass:

I have three acres ridge and clay land which I intend to sow to grass, and thought I would use orchard grass, Kentucky blue grass and clover. Would that be a good mixture, and what amount of each would you use? J. C. J.
Cuyahoga Co., Ohio.



If you want it for permanent pasture, we would plow it in July, top dress, if possible, cultivate about once a week until Sept. 10th, drill in 8 pecks per acre of good wheat, with 300 lbs. per acre of good superphosphate, and after ten days or so, sow broadcast 4 to 6 quarts of timothy and 30 quarts of recleaned blue grass seed per acre, and early in March when the land is honey-combed with a "sugar freeze," broadcast 4 to 6 quarts of medium clover seed, and a bushel of orchard grass, and do not pasture or mow before June of the year following, unless it be to clip the stubble to kill the weeds, in September or early October after wheat harvest. Thus you can get good pasture.

C. M. G., Adams Co., O., has 160 acres of rather poor land in the southern part of Adams Co. It is more than he wants to "farm" and he wishes to seed it, and asks about lime, commercial fertilizers, and other questions to be inferred from our replies:



Yours is in the non-glaciated, hilly, limestone part of the state. We would not advise lime as a fertilizer on such land. Better use good, high-grade acid phosphate and tankage if you can get the latter, mixed thoroughly at the rate of 200 lbs. of the former to 100 lbs. of the latter. Seed to wheat, 6 to 8 pecks per acre, late in September and soon afterwards sow broadcast 3 pecks per acre of "recleaned" or hulled blue-grass; seed 4 quarts per acre of timothy and in the spring, 4 to 6 quarts per acre of medium clover seed. We would not advise orchard grass under the circumstances.

ILLUSTRATION

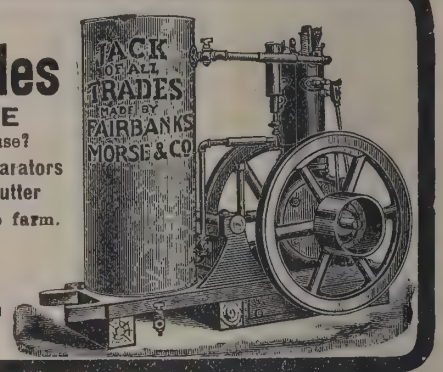
What some people say of the metal wheels and wagons made by the Electric Wheel Co., Box 130, Quincy, Illinois:

Platte City, Mo., Jan. 25, 1903. Gentlemen:—The wheels I got of you carried an old Spanish cannon from Tracey to Platte City over a turnpike road with rocks sticking above the surface 4 inches. The cannon weighed 14,000 pounds and people expected to see the wheels break down, but they didn't. I broke two axles and pulled the tougue out once, but the wheels did not break, and if in 1000 years from now anyone visits Platte City, the old cannon will still be standing, and people will tell about the little spindling wheels that carried it there. Yours truly, J. C. H.

Dover, N. H., April 6, 1902. Dear Sirs:—From your catalogue I believe you sent me stronger wheels than I ordered. You must have thought I was looking for a bargain and I certainly got one, as they are as good to-day as when they left the shop and run ⅓ easier on smooth hard road and ⅔ easier on a soft or sandy road. We would have better roads with less expense, could draw the same load easier, have fewer balky horses, and our chances of reaching Heaven would be increased 25% if we all used wide tired metal wheels. Thanking you for the new catalogue and booklet, I am truly yours, C. E. H.

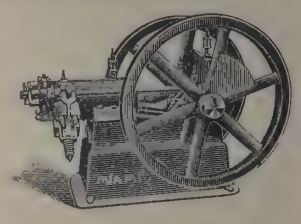
Augusta, Mont., March 4, 1902. Gentlemen,—Will tell you the same as I tell everybody else—you make the best wheel I ever saw stuck on a wagon. My wheels are ½ inch tires 5 inches wide and will bet money they will carry 9000 pounds on fair roads. When I unloaded your wagon there (Appleton City, Mo.) I put on a four-horse load of hog wire from Chicago and drove uptown to hear remarks. The only serious objection I heard was that those 5 inch tires would not cut down in the mud properly. Very respectfully, J. V.

Evansville, Ind., April 21, 1902. Gentlemen—Some time ago I bought a set of metal wheels of you and like them very much. I have trouble keeping my wagon at home as my neighbors have bothered the life out of me ever since I got it. I would not do without it, and never use my high wagon at all, except when my neighbors have my little wagon. As ever, I remain, yours respectfully, C. H.



The original of all these letters can be seen at the office of the Electric Wheel Co., Quincy, Ill., to whose wheels and wagons they refer. Better send for their free catalogue and know more about their wheels and wagons.

TRADE MARK OTTO



FOR 27 YEARS This EMBLEM has stood for advanced design, best construction and greatest efficiency in GAS and GASOLINE ENGINES.

THE OTTO GAS ENGINE WORKS,

The Averill & Gregory Sale of Holsteins.

(Continued from page 458)

had failed, when Dr. W. N. Landon, of this city, who had been a silent spectator of the proceedings, got a round of applause when he bid $1,600, at which price the cow was finally knocked down to him.

"The biggest price since the Wales sales in 1888, said Mr. Fargo, who is an authority, and there was more enthusiasm.

Cash Value of Manure.

A bulletin recently issued by the Department of Agriculture emphasizes the value of manure and its economical employment upon the farm. It says experiments show that the fertilizing value of the manure of our domestic animals for one year is as follows: for the horse $27, for the cow $19, for the hog $27 and for the sheep $2. Computing the total value of the fertilizing ingredients according to the number of animals reported in the live stock census of 1900, we have for the enormous aggregate, in round numbers, $2,774,000,000, not an insignificant figure by any means. The result, although approximate, is correct in representing the commercial value of the fertilizing elements, nitrogen, phosphoric acid and potash, as found in the animal excreta.

Of course it is impossible for the farmer in general to go to the expense and trouble of shedding his barnyard to guard against extremes of drought or moisture, exposure and heat, or for the erection of a lean-to in connection with his stable and the consequent attention involved, but it is possible and highly practicable for every farmer to attach such importance to this valuable farm product (for such it is), as to utilize it in the most practicable manner possible in sustaining the fertility of his farm and in increasing the mechanical and physical conditions of the soil.

Some of the more important points in the summary are given below:

1. Barnyard manure represents fertility drawn from the soil, which must be returned if productiveness is to be maintained.

2. The value of manure obtained in cattle feeding often represents largely the profits of feeding.

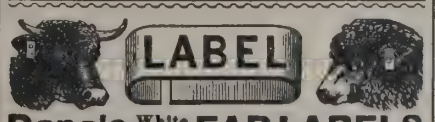
3. Manure contains the fertilizing elements of the soil, renders the already present elements more available, improves mechanical condition, makes it warmer and enables it to retain more moisture or draw it up from below.

4. The urine is the most valuable part of the excreta, containing much nitrogen and potash in easily available forms. The nitrogen easily escapes into the air unless the manure is mixed with the solid excrement or straw.

5. Poultry manure ranks highest in fertilizing value, while sheep, pig, horse and cow manure follow in respective order.

6. In a given class of animals the value of their manure is determined more largely by their food than by any other factor.

6 Deterioration of manure results from fermentation or by leaching or weathering.



8. When possible it is generally best to apply manure in the fresh condition, especially for improvement of the mechanical condition of heavy soils. Well-rotted manure is best for improving condition of light sandy soils.

9. Fresh manure has a forcing effect, and it is therefore better suited to the growth of grass and forage plants, than to cereals.

10. Direct application of fresh manure to root crops often proves injurious.

11. Manures should be spread on the land uniformly and not left in heaps. And it might be added that evenness of application is best obtained by use of the manure spreader. Unless the manure is applied evenly, the soil is only fertilized in spots and the best results cannot be expected.

12 Mixing of manures often conduces to rapid fermentation and the consequent loss of nitrogen by evaporation.

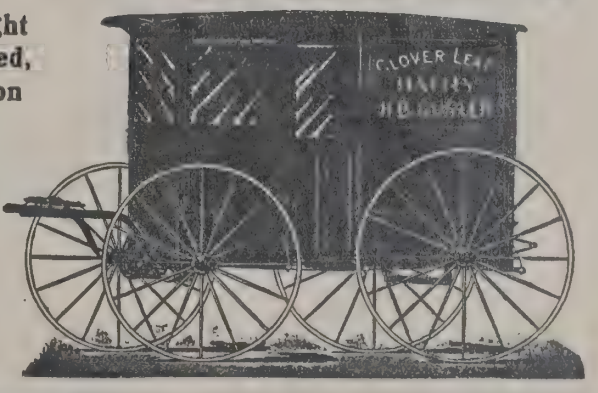
Your Dairy



May be kept ever so clean, your cattle may be pedigree stock and you may feed them in the most approved manner, but your patrons will never suspect these things if you deliver milk from a ramshackle wagon. An attractive milk wagon attracts trade; it's not a luxury, but a practical necessity.

The Koenig & Luhrs wagons are built for the business. They embody every convenience, are handsome in finish and general appearance, are made of good materials and are so well put together that they'll last for years. A quarter of a century's practical experience has taught us the "know how" of good wagon building. Are you considering a new wagon? It will pay you to get our catalog and prices before placing your order.

CLIMAX
Ensilage and Feed Cutters.

SOMETHING DIFFERENT. CLIMAX machines are not like others. Old ideas have been discarded, and the features are exclusive and original. Some of them are

STRAIGHT KNIVES. Easy to keep in order. Cheap to replace. Cut the material more evenly and do more of it.

ELEVATING. This is done with the same wheel as the cutting. Requires less power and NEVER clogs.

SMOOTH REVERSING GEAR. With this gear there are no cog wheels to break. The machine can be stopped or reversed in an instant without danger of breakage.

SIMPLICITY. No Feed Cutter made has so few wearing parts.

IT IS MOUNTED. Being specially built on trucks, it is just the right height for feeding No platform is required.

All these features are the result of long experience. They mean easier and quicker work and better results. Send for catalogue today.

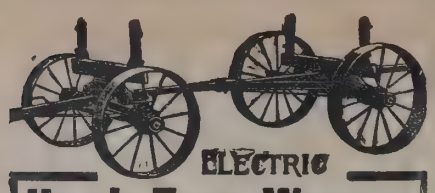
CHICAGO FLEXIBLE SHAFT CO.,
194 Ontario St., Chicago, Ill.

The Price is Right

Never until this year has it been possible to buy a cream separator of from 3200 lbs. to 3600 lbs. actual skimming capacity for $300.00, nor one of 2500 lbs. to 2800 lbs. capacity for $290.00. By the old plan of selling it was necessary to charge about $200.00 more to cover selling commissions, traveling expenses, experts' services, etc., etc. We have cut out these expenses and the creameryman is receiving the benefit. Isn't $200.00 worth saving? If you think so, buy a large capacity SUSPENDED BOWL FACTORY TUBULAR for $300.00.

THE Proposition is Right



You are not asked to take any chances on the TUBULAR. Any responsible creameryman in America can have one on trial with no obligation whatever to buy or keep it. We would not want him to buy it unless he is convinced of its being the best separator he has ever seen. We will take our chances on his wanting to keep it. Isn't this proposition all right?

THE Separator is Right

The 1903 Suspended Bowl Factory Tubular Separator will skim ordinarily at two one-hundredths of one per cent.; when conditions are favorable less than one one-hundredth, and never above five one-hundredths. The large capacity TUBULAR requires less than 30 lbs. steam pressure—a little more than half the requirement of any other separator. It will skim without clogging longer than other separator, and it is built to wear. Don't you think a separator of that kind is about right?

Let us send you catalogue No. 144.

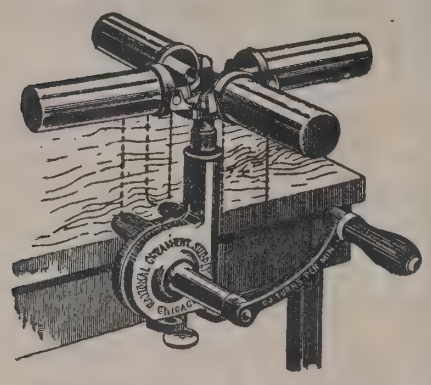
28, 30 & 32 So. Canal St. West Chester, Pa
CHICAGO, ILL. U. S. A.

ELECTRIC



Handy Farm Wagons

make the work easier for both the man and team. The tires being wide they do not cut into the ground; the labor of loading is reduced many times, because of the short lift. They are equipped with our famous **Electric Steel Wheels**, either straight or stagger spokes. Wheels any height from 24 to 60 inches. White hickory axles, steel hounds. **Guaranteed to carry 4000 lbs.** Why not get started right by putting in one of these wagons. We make our steel wheels to fit any wagon. Write for the catalog. It is free.

ELECTRIC WHEEL CO., BOX 130, QUINCY, ILL.

NATIONAL

Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

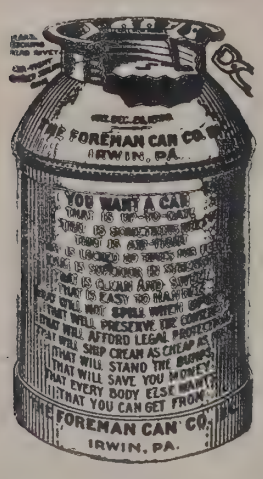
Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitable than an unprofitable cow.

NET PRICES:



No. 1,—2 bottle, complete for testing milk.... each $4 00
No. 2,—4 bottle, complete for testing milk.... each 5 00
No. 3,—2 bottle, complete for testing cream and milk, each..... 4 50
No. 4,—4 bottle, complete for testing cream and milk, each..... 5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, dipette and test bottles.

We are the great Dairy Supply House of the West. We carry an immense stock of all kinds of Butter and Cheese Making Apparatus and Supplies. Write for catalogues and circulars.

WHY ARE MEN SO UNWILLING TO LEARN?

A devoted friend of the HOARD'S DAIRYMAN in New York, writes us a letter on business matters, but there is one statement he makes which we think other men should read. He was describing the strange indifference of the farmers about him to their own improvement in dairy knowledge, and says:

"It seems as if they really prefer ignorance to knowledge. I labor with them every chance I can get. They come to me for advice. If they have a sick cow, they will ask me to look over my file of the DAIRYMAN and see if there is any thing there that will hit the case, and I often find something that will help them. But when it comes to themselves they will not read on dairy questions. They have seen the improvement in my own case. I tell them that every new and valuable idea I have I have got from the DAIRYMAN. They can see it and they know it. Yet after all this, they will not read. I cannot believe they lack in brains for they will take political papers. They admit that they must read if they keep posted in politics.

I was a good deal the same way at first. But about the second sample copy of the DAIRYMAN I got, over 10 years ago, showed me that I needed to know more about this cow business if I wanted to make any money at it. I have read the paper ever since, and keep it filed and bound. It has been worth hundreds of dollars to me. A few of my neighbors are taking hold in the same way, but it required constant talking on my part to get them started. But the majority of them are as indifferent to their own betterment in dairy understanding, as they would be if they were made of wood. I do not believe they will ever make any progress in knowledge, or make any money as long as they think and act as they do now."

The Value of Sugar Beet Pulp.

Prof. B.C. Buffum sums up the question of the use of the pulp in a bulletin of the Colorado Station as follows:

It should be stated that the attempts to compute the cash value of pulp compared with other foods do not indicate its total value. It supplies a succulent food at a time when such food is either not available or is scarce, and its effect on stock seems to be much more favorable than either its chemical analysis or the return in increased meat or milk would indicate. To its actual nutritive effect as a food should be added its general effect on the quality of meat and milk and on the animal system. Pulp undoubtedly overcomes much of the injurious effects of dry and concentrated foods, puts the system in good sanitary condition, keeps off disease, and so aids the appetite and digestion and assimilation of food that there is less waste, both of food which is generally discarded in eating, and that which usually passes through the animal undigested.

There seems to be no difficulty in regard to keeping beet pulp. While there is some loss of material when placed in open piles, the fermentation which takes place seems to be beneficial rather than otherwise. Animals eat the sour pulp as well, and after a little time even better than they do the pulp fresh from the factory, and the dry beet chips on the surface of the piles are very palatable to sheep and cattle. Nebraska feeders claim that pulp which has been left in open piles for two or three years is as good as ever.

No injurious effects have been observed from feeding pulp, unless too large amounts are given before the animals become accustomed to it. * * *

The greatest difficulty with pulp feeding is that the large amount of water it contains makes it heavy and rather expensive to handle, and it is sometimes difficult to keep the animals dry and comfortable while feeding large amounts of it. The feeder who is near the factory and has the appliances so arranged that he can handle the pulp with the least expense, should make the greatest use of pulp and will gain the greatest profit from its use. If it can be placed before stock at a cost of not more than $1 per ton, we believe it will bring good returns for the investment, and in many instances it may be worth two to three times this amount. Whether fresh, fermented or dry, beet pulp is a valuable stock food, and one of which our farmers should make the largest possible use.

FURNACE HEAT
FOR FARM HOUSES

THE LEADER STEEL FURNACE is especially adapted to heating farm and village homes. It is shipped direct from the factory to the user, all ready to set up. No trust or middleman gets a profit. Any handy man can set it up without trouble after reading our directions. We furnish every needed attachment and pay the freight. Hundreds have been sold within the last three years and these have given such good satisfaction that they are selling hundreds more. As many as eleven big rooms can be kept delightfully warm in any weather with the same fuel that two stoves would consume. The makers sell it to the buyers. Only one fire to look after. No dust, dirt, smoke or space filling stoves to bother with. Needs but little attention. You will be surprised to learn how cheaply your house can be fitted with a modern furnace. Estimates free. Send for free booklet No. 35 about this furnace.

HESS WARMING & VENTILATING COMPANY, CHICAGO, ILL.

WRINGING WET Clothes dry is the reason for using any wringer. Saving clothes, buttons and money is the reason for using **Horse-Shoe Brand Wringers.** They are made with rolls of the finest Para Rubber. Every wringer is warranted. **THE AMERICAN WRINGER CO., 99 Chambers Street, New York.**

Notes on the Creamery Patrons' Investigation at the Bainbridge, N. Y., Creamery.

Ed. Hoard's Dairyman:—One of the creamery patron investigations instituted by Hoard's Dairyman has recently been made among the patrons of the creamery at Bainbridge, N. Y. This creamery is a notable one. Its management has taken the initiative in several important matters during its brief but eventful history of some fifteen years. What few creameries had operated in the vicinity previous to this one, were accustomed to pay their patrons at somewhat irregular intervals. Here, almost from the first, the milk has been purchased at a definite price, and payments have invariably been made upon the 20th of every month for the milk of the previous month.

As the region about the creamery is included in the Catskill foot hills, hauling the skim milk home is a somewhat unpleasant task for the patron, consequently one of the chief problems for the creamery proprietor for several years, was to find a profitable use for the skim. At one time a concern which had been induced to erect a laboratory near the creamery, took considerable quantities of skim milk to be utilized in the manufacture of certain invalid foods. Later when experiments were made to employ casein as a coating or sizing for paper, this creamery was one of the first to successfully accomplish its production. It was not long after the casein business proved its practicability that farmers found it necessary to pay about twenty-five cents per hundred for skim milk. Then, too late to retain their hold upon it, farmers began to realize something of the value of skim milk when fed on their farms.

At the creamery there was still a waste product, as no use had been found for the whey. It was not long, however, before the National Milk Sugar Company put in operation, across the way, a laboratory for the production of sugar of milk, taking whey from this and other creameries in the vicinity.

While a large amount of casein has been produced in the past, and recent improvements make it possible to produce still larger amounts, the demand for bakers' cheese and other products of skim milk has been so great at times, particularly in winter, that all the skim has been turned to the production of these products. High grade cream and bakers' cheese were the chief articles of sale last winter, but with the return of warmer weather, butter making and the manufacture of casein again receive attention. Butter, cream of various degrees of richness, clarified and bottled milk, several varieties of cheese, including Italian cheese, casein for paper sizing and whey for sugar of milk are the principal products sold from this creamery.

It is apparent that the business of this concern should increase, and increase it has. Its patronage extends further and is more general than formerly; the demand for its products is widening, and there seems to be ample reason for the claim that this is the largest creamery concern in America where the business is all conducted at a single point. In its dealings with patrons the ground is taken that to get the milk the most liberal prices must be paid consistent with requirements. An effort has also been made for sometime to interest farmers in furnishing richer milk. For example, a certain fixed price is made for milk not testing above 4 per cent butter fat, and another price from ten to twenty cents per hundred higher, is fixed for milk testing 4.4 per cent, and for that testing between the two extremes a proportionate price is paid.

Perhaps an example will make this clearer. In January, milk testing not to exceed 4 per cent was paid for at $1.45 per one hundred pounds, and that testing 4.4 per cent, $1.65 per hundred. If a dairy averaged to test 4.3 per cent, the price was $1.60. Prices are ruling higher this year, and winter milk, in particular, is likely to be in good demand. A brief history of this concern may interest many readers of Hoard's Dairyman.

In 1888 M. C. C. Hovey and Mr. Fred White, both residents of this town, started the Bainbridge creamery. The building was 80 feet long and 40 ft. wide and one story high. It cost for erection and equipment about six thousand dollars. Annex after annex has since been built, another story added, a barn erected, a cold storage plant installed, and recently a building for drying curd and for a feed store has been equipped. The creamery and cold storage have now a floor of nearly 16,000 square feet and the newly equipped building has over 13,000 square feet additional.

In the former department there are twenty-seven rooms. Since the concern opened its doors for business, it has never closed them for a day, even during all the changes that have been made in the buildings and in the personnel of the company. Early in its history Capt L. R. Clark became a member of the company. A little later Mr. White withdrew, and after a time Mr. Clark did the same, leaving Mr. Hovey sole proprietor. From this time on there was really no change in the ownership till April 1902, when Mr. Hovey sold out to the Casein Co. of America.

During all these years Mr. Hovey was practically the only one interested in the management. For a considerable portion of the time he was educating his eldest son, Mr. W. W. Hovey, to become a successful creamery manager. This young man engaged himself in one department after another until he became familiar with every detail of the creamery work. At the same time he was carrying on his studies in the high school from which he was graduated. A course in a good school of business followed, and then he took charge of the office work in the creamery. The usefulness of all this special preparation becomes apparent when with the change of ownership the younger Mr. Hovey was engaged as general manager.

Regarding the sale to the Casein Co. of America, there can be little doubt but that a good price was paid, but the report, published in some papers at the time, that the property changed hands at $250,000 was surely based upon an exaggerated estimate. It is probable that the price mentioned might be cut in two, and then discounted liberally before reaching the correct figures. Since the change of ownership, upwards of forty thousand dollars have been expended in improvements and better equipments. A large part of the purchase price was for "good will," which means, of course, the energy and business ability that had been put into building up the trade and establishing profitable relations with milk producers of the vicinity.

In the Dairyman's investigation among the patrons of this creamery, it was shown that the one hundred patrons reported were making an average profit of somewhat less than one per cent on the cost of the feed. Only a few of these dairymen expressed themselves as opposed to good farm papers, but on going over the list, it appears that only thirty-five out of the hundred can be considered as careful readers of dairy subjects. Every one of the thirty-five shows a profit made on the cost of the feed. Of the remaining sixty-five, thirteen make a profit as shown by the schedule, while fifty are actual losers. The thirty-five who are readers get an average return of $49.66 per cow, while the remaining sixty-five get an average of $32.23 per cow, a difference of $17.43 per cow in favor of the man who studies his business. Those who study expend an average of $1.68 more per cow for feed, but that $1.68, together with enlightened judgment, returns 1,037 per cent of itself.

Chenango Co., N. Y. H. H. Lyon.

A Grade Holstein Record.

Ed. Hoard's Dairyman:—Perhaps a complete record of my Grade Holstein cow, "Delilah" will be of interest to you. Her picture appeared in the Dairyman about two or three years ago with one year's record. Her complete record is as follows: From July 4, '98 to May 23, '03, or six weeks short of 5 yrs.

In 1898, milking period was 44 weeks and made 10,965 lbs. milk; average test, 4.4, sufficient to made 554 lbs. of 85% butter.

In 1899, milked 44 weeks, making 12,062 lbs. milk; average test, 3.875, making 537 lbs. of butter.

In 1900, milked 50 weeks and gave 13,926 lbs. milk testing 3.75. Making 600 lbs. of butter.

In 1901, counting 48 weeks, gave 16,637 lbs. milk, testing 4.06; making 776 lbs. butter, and she became barren and continued her work 42 weeks longer and gave 7,546 lbs., testing 4.5, making 390 lbs. of butter.

She milked in the 5 years, 228 weeks and was dry 26 weeks. Average lbs. of butter per week, 12 53-100. Average lbs. of milk per week, 268.

Her best week was 447 lbs. of milk, and her best butter test was 752 lbs. of milk testing 4.7, making 40.64 lbs. of butter in 14 days. In August of 1901, her feed was alfalfa with short season of pasture each year. About 3 years of the time she had brewers wet grain and corn chop, and for two years bran instead of brewers grain. May 23 last she weighed at the stock yards, 1260 lbs. and neted me $42.00.

Now had this cow been a dual-purpose cow, how much more would she have been worth for beef, and how much less would she have returned in products? In the five years the tests were the Babcock 14 days composit test, every three months, while this record was being made.

She was a very good representative of the dairy form as taught by the Dairyman, which has been very valuable to me, and, with practical experience, has made me very emphatic in selecting a cow for the dairy to get the dairy form and avoid the "dual cow," that some of our friends seem to admire. Perhaps they admire them more from sight than from records and calculation.

Denver, Col. C. E. Bull.

It Pays to Keep Posted.

Read agricultural papers, books and daily papers with market reports. Don't say you haven't time to read nor the money to pay for papers, because you have. A short time ago two farmers, A and B, met shortly after receiving their monthly dividend at the butter factory. A says to B, what did your cows test? B answered, 5%, and I get 95c per 100 lbs. for my milk. Said A, mine test only 4% and I get 76c per 100 lbs. I am going to sell my cows and get some that will pay better.

C, wanting some cows, and having read agricultural papers, looked up the weigh sheets at the creamery; this is what he found. A's cows' average yield of milk per cow for the year in round numbers was 5,500 lbs., test 4%, price per 100 lbs. milk 76c, or $41.80 per cow. B's cows, 4,000 lbs. test 5%, price per 100 lbs. milk 95c, or $38 per cow. Here was a difference of $3.80 per cow in favor of A's herd, besides 1,500 lbs. milk extra for feeding purposes. C bought A's cows for $35 (B wanted $40 for his.)

D, is a country merchant who reads the market reports, and E, a farmer who does not. D sees that beans have advanced in market from $1.35 to $2.15. E comes to the village, D makes it a point to see him and says: "What about those beans I offered you $1.35 for the other day; are you going to bring them down?" E—"I told you that I was going to have $1.50 for those beans; there are 20 bus., and if you want them at my price, will bring them tomorrow." D—"All right, bring them in." Loss to E. $13.

C and D are getting wealthy. A, B and E just make a living and they cannot understand it, as they work hard and never spend a dollar foolishly, as they say. Now A, B and E, you subscribe for two or three agricultural papers, study the practical methods of farming contained therein and at the end of the year you will have saved something besides a living.—*Ex.*

Alfalfa Experience in Pennsylvania.

Ed. Hoard's Dairyman:—I will state my alfalfa experience as I see so few reports from this state and none from this county of Lancaster, with its fertile limestone soil.

Last summer, after taking off a soiling crop of corn, I harrowed the ground, being careful not to disturb the stalks, and thus obtained a seed bed two inches deep.

I have read every article concerning alfalfa, that has come under my notice, and with few exceptions they recommend a soil plowed as deep as possible, even sub-soiled. This I believe to be a grand mistake, under certain conditions.

We would suppose, from the nature of the plant, that alfalfa roots possess a penetrating power equal to that of our common red clover, or of corn roots, which we know enter the soil several feet at least below the depth of the plow. The object of plowing must therefore be merely to prepare a seed bed, and not to deepen the soil. I speak of good corn and clover land.

With the soil in proper condition as to fertility and alkalinity, the question of getting a catch of alfalfa is clearly one of moisture. Hence, we can see no reason for preparing the soil to a greater depth than that sufficient to guarantee a good germination of the seed, and a freshly plowed soil is not in condition to retain moisture.

We are told that young alfalfa is more susceptible to drouth than red clover. We know from experience and observation that red clover prefers a solid soil.

Except to bury rubbish, why then should we plow for alfalfa even deeper than we do for corn?

With these considerations in view, I prepared the soil as described above, and after applying thirty bushels of air-slacked lime to the acre plot, on August 16th I sowed and drilled in thirty pounds of alfalfa seed.

The seed was diluted with corn meal and run through the wheat distributors. A small portion of the plot was seeded by running the seed on top of the ground and this was covered with a weeder. For the greater portion, however, the hoes of the drill were permitted to run as deep as they would, and the seed was covered about an inch deep. This was done to get the seed below the dust of the surface, believing that it had sufficient vitality to push through. The entire plot was rolled.

The shallow seeding came up directly, but the other lingered, and it took some time for it all to come through, but soon gained upon the other and kept up a constant growth until winter, when the growth averaged thirteen inches.

The shallow sowing had troubles of its own and peculiar to itself, for dry weather set in when it was but a few inches high, and it looked sick, but pulled through and made sufficient growth to stand the winter well.

This spring the cold, wet weather appeared to affect the entire plat, but the shallow sowing to a much greater extent than the other. Because of this I mowed the entire plat the latter part of April. I have just finished mowing the plat as a soiling crop. Good judges said it would have made at least a ton of hay. The average stand was probably twenty-eight inches, but individual stalks stood as high as forty-three inches. This however, was true of only the deep sowing, the other did not reach a height of over eighteen inches, but was much thicker on the ground than appeared to be. The cows ate it greedily, being fed in connection with ensilage.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

Howmuch more net profit will there be in an acre of wheat yielding 20 bushels than in one yielding 15 bushels? On the first impulse most people would say thirty-three and one-third per cent more, because 20 is that much more than 15. But there is a difference between net profit and gross income, and it is consequently safe to say that a yield of 20 bushels is 100 per cent more profitable than one of 15 bushels. The same principal applies to the cows in a dairy herd. The cow that yields 20 lbs. of butter while another is yielding 15 lbs., gives fully 100 per cent more net profit.

SOME years ago, says the *Cosmopolitan Magazine*, some reformers in England learned to their horror that the operatives in certain factories were working under conditions that destroyed their lungs and left them on an average only a half dozen years of life. In their efforts to stop this waste of human life, they found their most persistent opponents among the very men they were trying to benefit. Such is the strange perversity of human nature. The same experience has come to HOARD'S DAIRYMAN in its efforts to work reform in the ideas and practices of dairy farmers, and to stop some of the fearful waste of labor, time and food that is constantly going on among them. The most pronounced opponents to such reforms are the men who are doing the most wasting, and suffering the most by it.

"THE DUAL-PURPOSE COW AGAIN."

Under the above title, *The Prairie Farmer*, in its issue for June 18 of the present year, endeavors to show that various grade and pure bred Shorthorn cows have been more profitable producers of milk and butter than dairy-bred grade animals, although, according to custom, it insists it has no intention of "claiming that the dual-purpose cow is ahead of the special dairy cow for strictly dairy work." In support of this contention, it refers again to the so-called milking trials in England, which last only two days, quotes quite fully from the reports of the Wisconsin Experiment Station for the years 1899 and 1900 and mentions other short term records and reports.

Its confessed purpose, both in the recent article and in another published last January, is to "demonstrate the fallacy of the position taken by HOARD'S DAIRYMAN and some other dairy writers, that there is no such thing as a dual-purpose cow, and that it is beyond the bounds of possibility to produce such a breed."

There would be some pertinence to this purpose if HOARD'S DAIRYMAN or any representative "dairy writer" had ever denied that there existed in all breeds, instances of phenomenal milk producers, or that in some sections in England there were herds of Short horns that had been bred for years with special reference to dairy ability. But in the United States deep milking Short horns are no more abundant than prize-worthy beef steers from dairy dams, and most unfortunately for *The Prairie Farmer's* argument it remains to be proven that these double-purpose individuals have any ability to transmit their peculiarities to offspring. There is no rule in breeding which can be relied upon to insure that the males shall make profitable steers and the females from the same sire and dam profitable dairy cows.

The misleading character of short term or single year records is nowhere more graphically set forth than in the Wisconsin Station report for 1900, which shows that one cow produced 110.90 pounds butter in one year and 324.81 pounds the next year, and another cow increased from 184.33 pounds to 364.56 pounds.

SOME IDEAS ABOUT BREEDING DAIRY CATTLE.

There are two theories before the world on this question: The theory of breeding for specific purpose and type, the theory of breeding for dual-purpose and type.

The first theory has behind it the clear, specific experience of those who have established dairy breeds of cattle, such for instance as the Jerseys and Guernseys as advanced butter breeds, giving milk of great richness in butter fat, and the Ayrshires and Holsteins giving milk in larger quantity, and of less per cent of fat.

These four breeds are called dairy bred cattle because in the main their breeders hold to the idea and purpose of making butter in the one case, and milk in the other, the main object of their breeding. In other words these four breeds of cattle are bred to a specific purpose and to a certain extent to a specific type or form, the so-called dairy form.

Nature has satisfied the purpose of these breeders by granting them increasing development of dairy capacity in their cattle, just as long as they have held steadily to their specific purpose. She has in every case punished them also, sooner or later, with loss of dairy capacity, as well as loss of *dairy heredity and prepotency*, whenever they have departed from the line of breeding for these specific purposes.

In this way, and *only in this way*, have we been enabled to establish breeds of cattle of specific dairy prepotency and the power of constant development in dairy productiveness.

Nature at her best is full of confusing variation. Breed as closely as we may to a specific purpose, there will still come to our hand plenty of failures. Too many breeders in the past have poisoned the stream with foolish fads, with ideas of breeding for meat as well as milk and butter, and their ideas have left their detracting effect on the procreative powers of the cattle we are now using. Do the best we can, we will have all the confusing diversity and variation we want, all the loss of dairy capacity we can take care of, without *breeding for it on purpose.*

Dairy breeders must never lose sight of the great principle that all future development lies in the direction of holding steadfastly to two principles: Breed for the single purpose of dairy capacity and strength of constitution.

By the term "development" we do not mean so much the production of phenomenal cows, as that there shall be less and less failures; a larger per cent of certainty that the resulting heifers will prove profitable cows, and the resulting bulls the sires of profitable cows.

If the foregoing premises are sound, it is plainly evident that no breeder of dairy cattle or dairy farmer can afford to meddle with the confusing heresy of "dual purpose."

AN APPRECIATIVE SOUTHERNER AND A CONTRAST.

The following postscript was attached to a letter received from Mr. Hooper Alexander, one of the leading lawyers of Atlanta, who is also much interested, in a practical way, in dairy work and enterprise:

"I have read your paper now for several years, and I do not flatter when I say that it is in my opinion the best paper in the United States, devoted to any specialty. The patience and courtesy with which you answer over and over again the same inquiries entitles you to a high place among the elect."

We quote the above very highly appreciated commendation for the purpose of showing the wide contrast which exists among men. Here is a gentleman of culture and thought who is deeply immersed in his other business, but who finds a little time to devote to a study of dairy questions. He reads and studies the DAIRYMAN and appreciates it, and is glad of the opportunity to take and pay for the services of a friend and counsellor such as it is.

Thousands of farmers all over the United States, who have their capital and time and labor invested in the business, and who really and constantly need the education such a paper would bring them and yet, "though an angel come down from Heaven" he could not induce them to take sufficient mental interest in their own business to subscribe for such a paper.

Not long since a leading merchant in a neighboring town, related to us the following incident. He was talking with a dairy farmer who was complaining of the hard time he was having to get along. The merchant, who is a keen business man, one who knows the value of keeping posted in his own business, asked the farmer if he read HOARD'S DAIRYMAN? "Imagine my surprise" he said "when this farmer broke out with a foolish rant about reading such papers. He said it was all rot, and no farmer could afford to spend his time that way.'" He confessed to me that neither he nor his family read anything but "story papers."

"Here was a man," said the merchant, "who was not ashamed to boast to me of his ignorance of his daily business, and how he kept his children in the same ignorance. At the same time he was owing me a store bill three years old, and yet was really proud of the fact that he never read dairy papers, did not know anything about what they treated upon, and was contented as a kitten in what he did not know."

This is the contrast—the lawyer and the farmer—one reaching out for all the knowledge he can obtain and thankful for it; the other, of choice, turning his back on the light and *boasting* that he is not one of "them fellers" that waste their time reading dairy papers. No wonder the lawyer is the man he is. Small wonder either that the other man is where he is. And let us say that there are thousands upon thousands of just such men keeping cows for a business in these United States.

Every improvement, every bit of progress, every increase in their own good fortune, has been forced upon them. Not a man among them ever did a thing or thought a thought that has helped along the dairy progress. They keep their minds as dark and blank as possible, and call themselves dairymen. They never know of any new improvement until some of the more intelligent have tried it and have enjoyed its benefits for ten years or so. They are down on books and papers that talk of the farm or the cow, but they are great on "story papers." What a help such men are to the cause of better farming and more prosperous farmers.

INDICATIONS OF CONSTITUTION IN DAIRY CATTLE.

The *Maritime Farmer* in an interesting article on "Breeding Dairy Cows For Production," defines constitution in dairy cattle by saying that "the wide chest, good heart girth," are the chief indications of constitution in a dairy cow. It seems to us as if the *Farmer* as well as many other writers has fallen into the old beef-type method of judging constitution in dairy cattle, and for want of a better knowledge is still keeping it up. They have only to look at the form of a race horse and his build about the heart and lungs and then compare him to the deep chested, wide-between-the-fore-legs form of the draft horse to see that there is something lacking in this old definition of constitution. Is the race horse deficient in constitution or staying power? Compare the setter and pointer dog with the deep chested bull dog. Does the hunting dog lack in constitution? Is either the race horse or hunting dog lacking in heart and lung power? Why, one minute of the work of the race horse calls for more breathing capacity and heart action than two days of the slow, steady pulling of the draft horse. And so in like manner it is with the hunting dog and his labor in the field.

The dairy cow does not lack constitution or staying power, in her chosen field, because she does not have the deep brisket and great width between the fore legs that mark the beef animal.

More than this, the beef outline is not an indication of large heart and lungs. We wonder sometimes if these beef outline advocates, ever examined the lungs and heart of a racehorse and dairy cow to see whether they were smaller in size and compacity for action than those of the draft and beef type. The form of the dairy cow like that of the race horse has been fashioned by the dominating effect of a peculiar function. Function always modifies form, builds it and shapes it to its own purpose.

But constitution is an independent quality, and must be present in all forms and functions, else the animal does not last well in its work. Constitution simply means vitality; power to endure; ability to resist disease and discouraging circumstances. It is largely derived from the brain and nervous system. This is shown more clearly in men.

It is found in men of slight form and fails in men of large chest girth. Its indications must be sought for in other lines than are indicated by the old Shorthorn doctrines and outline.

The construction of the walls of the abdomen, strong will and temper, active, alert bearing and action, are much better indications of enduring constitution than the formula generally given of "wide chest and good heart girth."

MILK FEVER.

Considerable complaint is heard throughout Wisconsin and the middle west, this year, in regard to milk fever. The disease is quite apt to prevail in moist seasons, where cows are allowed to calve on damp ground, or if they lie on such ground for several days before and after calving. Dr. Peters, of the Nebraska Experiment Station, gives the following simple formula for using the Schmidt cure:

"First wash the udder thoroughly and the operator's hands with soap and water, removing all the dirt; then the udder should be thoroughly milked. Each

quarter should be entirely empty. After this is done an ordinary milk tube is inserted. The milk tube, rubber tubing and funnel should be thoroughly sterilized before using. If a funnel is not available an ordinary fountain syringe that has been thoroughly cleansed and sterilized by allowing hot water to run through it may be used. The solution injected into the udder is made by dissolving two drams of iodide of potassium in one pint of boiling water. This solution is allowed to cool to that of the body temperature, and then one-fourth of it is injected into each quarter of the udder. The udder should be previously cleaned and disinfected with a 5 per cent solution of carbolic acid. After the solution has been injected rub the udder from ten to fifteen minutes. Allow the solution to remain in the udder from an hour to an hour and a half, and then milk it out. If it is necessary this treatment may be repeated within eight or ten hours. The disease has been greatly reduced by this treatment.

"Recently a modification of this treatment has been in use. The entire udder is inflated with air. The udder is first thoroughly washed and cleansed with an antiseptic solution such as carbolic acid, 5 per cent. Each quarter is thoroughly milked and then inflated with air. This is done by attaching a pump to the ordinary milk tube that has been inserted into the udder. After the udder is filled with air, massage or rub it from twenty to forty minutes, so as to distribute the air throughout the entire udder. This method has given very good satisfaction.

Prevention is far better than cure. The DAIRYMAN would urge that all cows that are heavy milkers in particular be placed in a comfortable box stall if possible fully a week before calving, and a pound dose or two of Epsom salts be administered. After calving keep the cow in the stall for four days, giving her all the luke warm water she will drink, with a little oat meal sprinkled thereon. Be sure to keep the cow away from all draughts of air. Milk fever usually commences with a chill as does puerperal fever with women. It is a good plan not to empty the udder fully for four days, and let the calf remain by her side. Thoroughly disinfect the stall every day with a strong whitewash or carbolic acid.

DAIRY FARMING.

A Pennsylvania correspondent writes thus:

"I like HOARD'S DAIRYMAN for a good many things. More than any other paper that I am acquainted with, it tries to get things and principles connected with dairying, down to a practical definition where the comprehension of common men can get hold of their meaning. But I particularly like the paper because it pays especial attention to the problems of the dairy farm. There are a good many of these problems and the best of us are all the time at our wits end to know just what to do. It would please me very much if you would give me a résumé of what you think are the problems of the American dairy farm. Bunch them together once, and let us see how they look as a whole.

Yours truly,
J. S. MUNSON.

Bradford Co., Pa.

Our correspondent sets us at no very easy task, for the problems that confront the dairy farmer almost every day are as infinite in character as are the almost infinite variations of vegetable and animal life.

We should first understand that the dairy farmer is dealing with *life*. Though he be ever so well educated and trained, the great ocean of facts is a thousand times greater than he is. Of course the advantage is greatly on the side of the man who makes of himself an intelligent student of these facts. Ignorance helps no man. About as good an epitome as we have ever seen of what we should strive to study, and as far as we can to master, is found in the following statement of the Course of Study at the British Dairy Institute, Reading, England.

"General management of a dairy farm; soils, manures and cropping; use of home-grown and purchased foods; composition and preparation of different kinds of foods; compounding of food rations; grasses and forage plants; management of pastures; farm live stock; breeds of dairy cattle; management of milk cows, dry cows, feeding cattle and young stock during summer and winter; the feeding and rearing of calves; the best breeds of pigs and their management."

Here comes one of the most important branches of knowledge—"The sanitary arrangements of a dairy farm, water supply, animal hygiene, etc." On this point alone, how to provide for the health and better efficiency of our farm animals, there exists a most appalling state of ignorance among American farmers, and largely so because few of them believe they need any special study, or stock of knowledge on that point more than they now possess.

To all of the above we may add—the construction of stables and other farm buildings in a healthful, economical and efficient manner. Most men ask but two questions when they set out to build a stable or barn (1) "How cheaply can I do it? (2) How can I make it most handy for myself?" no matter whether it is all right for the cow or not.

Those persons who think it is an easy thing to comprehend all there is to know, and that they can do this with uninformed minds, can tell by looking over the foregoing list what the best informed dairy authorities think of the proposition.

There is scarcely a day in which the dairy farmer is not called upon to exercise the best judgment he can obtain on the foregoing points. Is it not time they were made the subject of especial study by the men who profess to be dairymen?

FEEDING TERMS.

Judging from letters and inquiries received, the terms, scientific and practical that are used in dairying and feeding are often stumbling blocks before the feet of many of our readers, and it is probable that in many cases readers hestitate to acknowledge even to themselves, that ignorance of the meaning of these terms forms a decided obstacle to the better understanding of the science of dairying.

Everyone is more or less subject to the same trouble, and the man who keeps up with the procession must be constantly familiarizing himself with the terms that are constantly being formed by scientific workers to explain conditions and methods for which there are no words in English, and which would otherwise require a phrase or even a sentence to explain. Recently we received a new work on animal nutrition and on looking it over we find metabolism, katabolism, anabolism, and a few others of like nature that sent us at once to the dictionary for information.

Unfortunately for the average reader, the dictionary assumes frequently that the seeker for knowledge in a certain branch has a wide assortment of knowledge in other branches. Supposing a dairyman, to whom the terms used in feeding are somewhat new, goes to the dictionary to find out what albuminoids are and he finds the following. "Albuminoids: One of the class of organic principles which form the main part of organized tissues." This may be clear to some but it does not throw much light nor assist the seeker after knowledge.

The fact is that very few of the terms used in feeding can be defined in a few words and carry to the mind of the inquirer any clear meaning of what the term actually means, and this is especially so where there are two words that are used to indicate the same substance. Thus, albuminoids and proteids are used for names of substances containing nitrogen, and that can be used for foods, or that are derived from foods digested and assimilated by the living animal.

Of this class the white of egg and the casein of milk are the most common examples, but they are only two of a long series of bodies that can be used as food and that vary slightly in taste and appearance according to the source from which they are obtained. There is not a living thing in the world, from bacteria up, that does not contain albuminoids of some kind, and the number of varieties is probably beyond calculation.

Like all other nutrients, the albuminoids go through a long series of building up and decomposing, continually being made and unmade. The great reservoir and starting point is the air that contains a large per cent of nitrogen. By various methods chemical, physical and bacterial, this nitrogen is changed into bodies that can be used as food by plants. The plants work over these products derived from the air and store them up as albuminoids, which can then be used as food by animals.

The animal works over this material, uses a little of it to supply its own wants and in the process makes a large part of it into substances that can again be used by plants to form more albuminoids, which are again used by animals, etc.

A little of the nitrogen is wasted each time a change is made, and that goes back to the air again, to be finally captured once more and started on its rounds through plant, animal, bacteria—a kind of perpetual motion as it were—without which all life would come to a sudden stop.

Professor Homer C. Price, Professor of Horticulture and Forestry, Iowa State College, has been elected Dean of the College of Agriculture and Domestic Science and Head of the Department of Agriculture of the Ohio State University, with the title of Professor of Rural Economics, and will enter upon his new duties in July.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Plan for Small Barn Wanted.

Enclosed find 25 cents for subscription to your paper for such a length of time as 25 cents will pay for. I want to build a small cow barn, one that will accommodate, say, 3 cows in milk and 3 or 4 calves and heifers, the whole arranged with a view to handiness in feeding and saving manure. If back numbers of your paper contain plans of such a small barn, the entire subscription taken in back numbers would suit me just as well. M. L.
Clinton, Miss.

Our personal experience, corroborated by observation, is that a small barn is never large enough. Either the amount of stock to be stabled increases beyond anticipation or the barn becomes a convenient place for shelter and storage for the thousand and one things that accumulate, either on the farm or about a city or town residence. While it is true that we have published, at different times, suggestions for small and large barns, we do not recall any that would seem to meet the requirements of this particular inquirer. Indeed, without further and more specific information, we find it difficult to form very much of a conception as to the requirements he has in mind. We estimate that the six or seven animals to be provided for will require a space at least 13×26 feet in the clear for stable accommodations. This will provide a convenient passage way and stall room for the seven animals. In addition, there would be required more or less room on the same level with the stable for the storage of ground feed, tools and so forth. The amount of room to be appropriated for this purpose will depend somewhat upon the location and character of the surroundings. A feeding alley in front of the cows four feet wide might be considered ample, or a space 8 to 12 feet wide might possibly be utilized.

We observe with much satisfaction that this inquirer wants provision made for saving the manure. This is a matter too much neglected everywhere. Where manure cannot be hauled direct from the stable to the field, the ideal method is to build a shed entirely disconnected from the stable; but where, for any reason, this is impracticable, a shed or shelter may be built alongside the stable. An open shed across one end or one side of the proposed barn six feet wide would probably afford all the shelter necessary for saving the manure, but a wider shed, open to the yard, might prove a very convenient place for the cows to take refuge under in case of storm or oppressive heat.

These suggestions indicate provision for a structure not less than 28 feet in width by 35 feet in length on the ground. Commencing at one end we would devote 12 feet to a manure shed, with a substantial partition between it and the stable proper. Next to this partition, would be a walk or passage five feet wide, then a gutter one foot wide, a platform four and one-half feet wide and then two feet for mangers, in front of which there would be at least eight feet in the clear. Let there be windows enough in this stable to make it fully as light as one would want an ordinary living room, and at some convenient place, provide a ventilating shaft with a cross section containing not less than two square feet. Concerning this matter of ventilation, see the communication from H. A. W., Pineville, Pa., and our answer thereto.

Milk, and Cream from Same, Tested and Great Difference in the Amount of Butter Fat Shown.

Would you kindly give me following information No doubt you have already answered similar questions, but it appears in a different light. A quantity of milk was sent to factory and tested as milk, the total butter fat amounted to 225 lbs. as per test. The cream from same milk was tested and total butter fat amounted to 175 lbs., being a difference of 50 lbs. butter fat. Both milk and cream were tested alike, same measurement. The cream, I presume, should be tested by 18 grams weight. Now would this make the difference? Since the hand separators are used we have at the factory both milk patrons and cream patrons so that above makes considerable difference.
Danville, Que. W. R. E.

The chances are, we think, that the samples taken for testing the cream were very light. The ordinary pipette will not deliver 18 grams of cream at any time, and if the sample is taken directly after the cream is separated, there will be so much air mixed with the cream that the sample will be very light indeed. A recent law in Wisconsin provides that in testing cream, the sample shall always be taken by weight and this is practically the only way to obtain the proper test.

In making a test of this kind, three or four different samples should be taken, one to check against another.

King System of Ventilation.—Quantity of Condition Powders to Feed.

Will you please explain what the King system of ventilation is, and how it is done for the ventilation of a barn. Please give the amount of condition powders that is to be fed to a horse, cow, or hog at one dose, that Mr. Cook advised feeding, on page 301. W. W.
Coopersville, Mich.

As more fully explained in our answer to H. A. W., of Pennsylvania, the King system of ventilation is based upon the principle of admitting fresh air at the ceiling and drawing off the cold and the impure air at the floor. The practical application of this principle in different cases must be governed by the special conditions in each case.

The formula for condition powders given on page 301, shows the principle ingredient to be linsend oil meal, and therefore, it may be safely fed, if necessary, in very considerable quantities, from a tablepoonful to a pint, twice a day. It should not be forgotten, however, that, as a rule, neither animals nor men need to be continually dosed with condition powders or medicine of any kind.

How to Keep 40 Cows on 65 Acres of Land.

In a recent number of the DAIRYMAN, page 417, you said 65 acres of tillable land would support 40 cows. What rotation of crops would you use in connection with corn to supply the necessary roughage? What provision should be made for pasture? NEW SUBSCIBER.
Bath, Ohio.

The statement we made, to which this inquirer refers, was based upon our knowledge of the fact that the inquirer in that case resides in one of the most productive sections in Wisconsin. There is probably just as good land in Ohio, but we are not sufficiently acquainted with Ohio conditions to justify a similar statement for every farm in that state. Given good land in Ohio, or elsewhere, we should depend very largely upon corn and alfalfa as the main crops, and devote very little acreage to pasture. We should expect to raise corn enough to fill silos and have considerable left over for cribbing. We should aim to keep a goodly number of hogs to take the skim milk to good advantage, and expect to use the money received for hogs in purchasing feed for the cows and other hogs. Alfalfa has not been recommended for a short rotation and we should, therefore, until more is learned about alfalfa, expect to grow some common clover, and possibly, wheat, oats and barley. These, however, are questions that can only be fully answered when one is entirely conversant with the soil, climate and markets. Mr. Terry, of Ohio, has found it very profitable to grow wheat and potatoes in connection with clover.

Soil Inoculation for Leguminous Plants.

Of the three elements going to make up the value of fertilizers, nitrogen is by far the most expensive. While this element is abundant in nature, forming four-fifths of the atmosphere, it is only under certain rare conditions that this uncombined nitrogen becomes available for plant growth. It has long been known that leguminous plants, such as clover, alfalfa and cow peas are unusually rich in nitrogen, and increase the nitrogen of the soils on which they grow. This was not explained until science brought out the fact that this family of plants is able to obtain nitrogen from the air. It has been found that the power of securing free nitrogen exists only when small nodules or tubercles containing bacteria are found on the roots. It is now generally believed that these bacteria draw their nitrogen from the air and convert it into forms which can be utilized by the plants on which the nodules grow,

In growing these renovating crops for improving the soil it is important to know whether the nodules are formed upon the roots. If they are not there, the greater benefit from growing such crops is lost and the soil makes no actual gain in nitrogen. Where a crop like clover has been grown at intervals for a series of years, it is probable that the soil will contain the proper bacteria for forming tubercles. It has been found, however, that the bacteria growing upon the roots of one legume, as clover, may not grow upon the roots of another genus, as the cow pea. Therefore, where the nodules are not formed, as is very probable with leguminous plants new to the section where planted, it is advisable in seeding the plants to also sow their proper inoculating bacteria. The absence of root tubercles will probably account for the reported failures of leguminous crops in many sections.

A recent report states that the soy bean has been grown at the Kansas Station since 1890. Only recently, however, have tubercles formed upon the roots, and this was brought about by artificial means. Inoculated soil was obtained from a soy bean field at the Massachusetts Station, and by scattering it over the Kansas land, plants with tubercles were grown, producing an increased yield and a higher percentage of nitrogen. Several methods of inoculating were tried. The seeds were thoroughly wetted in a bag suspended in water, into which the Massachusetts soil had been stirred. Again, the dry soil was sown broadcast over the fields, and in other cases was drilled with the seed. The best results were obtained by sowing inoculated soil in the drills. The method of securing inoculated soil and of inoculating a field is described as follows: In a 500 foot row incorporate 100 pounds of inoculated soil with the seed at the time of sowing. After harvesting the crop take up the soil in the row to a depth of 4 to 5 inches, spread on boards in the shade until dry, and sack. When planting a field to soy beans apply this soil with the seed by means of a fertilizer attachment to the grain drill.

The Alabama Station has experimented with commercial inoculating material (Nitragin) and inoculated soil on a variety of crops, but especially with hairy vetch and crimson clover as winter cover crops. It was found that while vetch and clover during the first year developed only a few tubercles on the station soil and made poor growth or failed entirely, they were after a few years of continuous growth abundantly supplied with them and made good growth. However, it would seem hardly profitable to wait for the slow action of natural inoculation when the desired result can be easily and quickly accomplished by artificial means. Where there is a small patch of clover, vetch, or peas, bearing root nodules, a field of a similar crop may be readily inoculated by using soil from the former. At the Alabama Station the crops were inoculated by applying soil from old fields and by dipping the seed previous to sowing in water into which had been stirred soil from an old garden. Artificial cultures (Nitragin) were also used, but their cost, together with liability to deteriorate, is believed to preclude their use in general farm practice.

In the experiments with hairy vetch grown on a soil for the first time, one lot of seed was dipped into a water solution of earth from an old garden spot where vetch had grown, and another was sown without treatment. The inoculated plants had large clusters of tubercles on the roots and produced 2,540 pounds per acre The soil of the inoculated plat, besides producing the larger crop, was left in much better mechanical condition. In a crop of crimson clover, seed inoculated with Nitrogin produced an average of 4,057 pounds; not inoculated, 761 pounds per acre Not only was the total amount of forage increased in the above instances, but there was a larger percentage of nitrogen in the inoculated plants. The total amounts of nitrogen contained per acre in the crops, were as follows: Hairy vetch—inoculated, 105.5 pounds; not inoculated, 7 lbs. Crimson clover—inoculated, 143.7 lbs; not inoculated 4.3 pounds.

In earlier experiments at this station, the average increase in weight of the inoculated plants, after thorough drying, was with hairy vetch, 89 per cent; Canada field peas, 138 per cent; crimson clover (young plants), 146 per cent. In a soil which had not borne leguminous plants for many years, some tubercles developed on hairy vetch, Canada field peas, crimson clover, lupines, cowpeas and Japan clover (*Lespedeza striata.*) Yet, even on this soil the increase in weight of plants by inoculation was with hairy vetch 38 per cent; Canada field peas, 58 per cent; and crimson clover, 79 per cent.

In experiments with hairy vetch at the Mississippi Station the yield was increased 64.6 per cent by scattering inoculated soil in the drills with the seed, and 34 per cent by soaking the seed in water containing the tubercle germs. The amount of nitrogen was also considerably increased by inoculation. The inoculation soil used was obtained from a field bearing hairy vetch which had an abundance of nodules. As regards methods of inoculation, the Mississippi Station makes the following statements:

There are at least three methods of inoculating soil with these germs. One mothod is to fiud a field on which a crop of vetch, peas or clover has grown, on the roots of which an abundance of nodules was developed. In such a case one may be sure that the soil of the old vetch or clover field is full of germs that escaped from the nodules when they decayed. Then draw dirt from this field, about 1 ton to the acre, and scatter as evenly as possible over the one to be inoculated. It shonld then be quickly harrowed in, especially if it is a hot, clear day, because sunshine kills the germs. The dirt should bc taken preferably from 2 to 3 inches below the surface. A second method is to obtain some earth from an old inoculated vetch or clover field, put it in a vessel, and pour water on it. Then stir thoroughly allow it to settle, and use this water to thoroughly wet the seeds to be sown. The water thus obtained is full of germs from the soil, which will stick to the seeds as they dry. Here again we should use care and not dry seed in sunlight. This seems to be the most economical way of inoculating a field. It is not a difficult matter to spread out a bushel or two of clover or vetch seed on an old cloth or tight floor, and sprinkle with plenty of the muddy germ water. The seeds may be left right there until they dry, if they are in the shade, and then are ready to sow. A third method is to buy a material known as Nitragin, This is simply gelatinous substance full of the germs one wishes to

BIT HIM

If It Had Been a Bear.

Sometimes it is good to be in a position where you can turn around to your shelves and take down food that is a rebuilder and life saver. A prominent grocer of Murrysville, Pa., had heard so many of his customers praising the food Grape-Nuts that he finally gave it a trial himself. He says: "For several years up to 16 months ago I was hardly fit for business from indigestion which also affected my head. My brain was dull and I could hardly keep my books.

"One day I heard one of my customers praising the food Grape-Nuts so highly that I wondered if it would fit my case, so I took a package from the shelf and said that I would use it and even if it failed I would not be much the loser.

"But before I had finished that one package such a change came over me that I thought it wonderful and by the time three packages had been eaten I had changed so you would not believe it if I told you about it. My head grew clear and my mind strong and my memory was very much improved and I was well in every respect. I can only give you a faint idea of all the good the food has done me. It is all I eat for supper nowadays and the rest of my family think as much of it as I do. Truly it is a great food and if it were not a great food it would not have done me so much good and have such a tremendous sale in my store." Name given by Postum Co., Battle Creek, Mich.

There are many reasons why the Improved

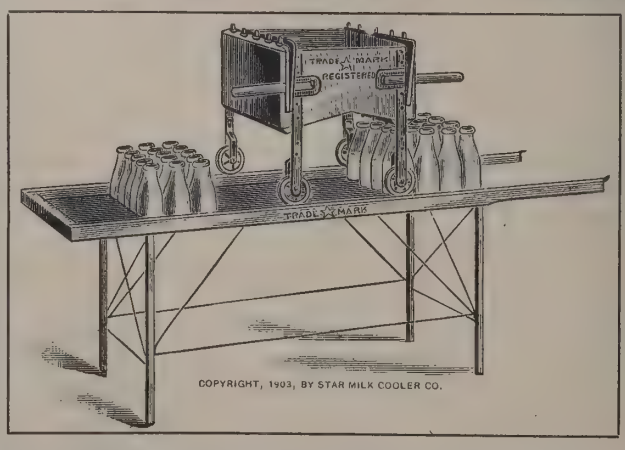
U. S. SEPARATOR IS THE ONE TO BUY

BELOW ARE A FEW OF THEM:

THE U. S.

Costs no more than inferior machines
Gets More Cream out of the Milk
Is less expensive to operate
Increases the quantity
Improves the quality
Will wear longer
Soon pays for itself
Has its gears enclosed
Bowl has few parts to wash
Has simple self-emptying Bowl
Has many other points of superiority
More fully described in our catalogues which are free for the asking, all making

The U. S. Separator the Standard Separator of the World



For Western customers, we transfer our separators from Chicago, LaCrosse, Minneapolis, Sioux City and Omaha. Address all letters to Bellows Falls, Vt.

use. It it is made in Germany, and consequently in the trip across the ocean and then to us it is liable to ferment and spoil.

Even if the Nitragin can be obtained in good condition, its cost renders its use of doubtful economy, as already stated.

In using inoculated soil it should be borne in mind that while experiments have shown that the germs from one plant will inoculate very closely related plants and even in some cases those distantly related, the best results will probably be obtained by using germs from the same species of plants as that which it is proposed to inoculate.

It is important to bear in mind that soil inoculation for leguminous plants is most valuable for poor soils deficient in nitrogen, and is not likely to prove profitable on soils abundantly supplied with available nitrogen. In experiments at the North Dakota Station with peas and red clover grown on pure sand and on a garden soil rich in nitrogen it was found that inoculation with Nitragin resulted in a largely increased yield in case of the sand, but produced little increase on the garden soil.—*Farmers Bulletin No. 124.*

The Dairy Exhibit at the St. Louis World's Fair.

ED. HOARD'S DAIRYMAN:—Thinking that the boys may want to hear something about the World's Fair, I will say that the Agricultural Palace, in which the dairy exhibits are to be located, will be 500 feet wide and 1600 feet long, and is now being built in the most desirable part of the grounds. The Dairy Products will be displayed in three mammoth plate glass refrigerators, each 90 feet long and 30 to 40 feet wide. The working dairy will be along the wall of the building near by the glass refrigerators and will occupy floor space of about 3,600 sq. feet and will be fitted with all the latest machinery and appliances. Here the milk from the dairy herds will be made up into butter and cheese. In order that the work in the dairy may be seen by all who so desire, the walls will be of glass. A number of leading dairy states have already applied for space and it is expected that the state exhibits of butter and cheese will be the largest and most attractive ever shown.

In the machinery line over 20,000 sq. feet of space have been applied for, and all the prominent manufacturers of dairy and creamery apparatus will take part.

There will also be working exhibits of sanitary milk plants, and fancy foreign and domestic cheese, and a large exhibit of butter and cheese from foreign countries. E. SUDENDORF,

Supt. Dairy Exhibits St. Louis World's Fair.

Silos and Alfalfa Important Problems.

Effect of Standing Water on Alfalfa.

ED. HOARD'S DAIRYMAN:—For nearly two years I have been a constant reader of the DAIRYMAN. There are two questions which have been discussed at length in the DAIRYMAN and which greatly interested me: viz., Alfalfa and the silos. The silo is easily solved and I expect to put one up this season, but the alfalfa is another thing, in which I cannot agree with you in all your teachings. I tried a little last year and while it proved a failure as a whole, the experience was worth the effort. The soil was clay loam to sand, subsoil, hard clay to sand. On the clay loam it froze out badly and on sand it stood quite badly but was slow starting in the spring. Where water stood on the low ground for three weeks in April it nearly all killed out. The question to me is: If standing water will kill alfalfa in 48 hours why will not three weeks under water kill all or nearly all on land adjoining that is elevated but a few inches? Even on the sand, the water stood on the surface for weeks while the frost slowly drew out.

Others are trying and I shall try again another year. The dry season obliges me to use the plot for soiling this year. Success to the DAIRYMAN. A. B. C.

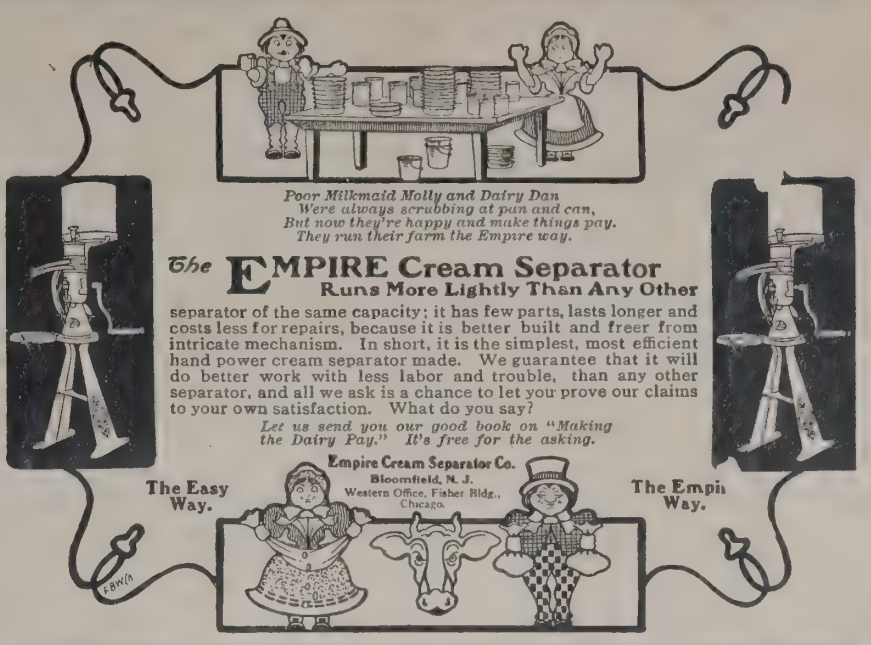
"ADVERTISEMENT."

SURE NOW

The Truth About Coffee.

It must be regarded as a convincing test when a family of 7 has used Postum for five years, regaining health and keeping healthy and strong on this food drink.

This family lives in Millville, Mass., and the lady of the household says: "For eight years my stomach troubled me all the time. I was very nervous and irritable and no medicine helped me.



"I had about given up hope until 5 years ago next month I read an article about Postum Cereal Coffee that convinced me that coffee was the cause of all my troubles. I made the Postum carefully and liked it so much I drank it in preference to coffee but without much faith that it would help me.

"At the end of a month however I was surprised to find such a change in my condition. I was stronger in every way, less nervous and at the end of 6 months I had recovered my strength so completely that I was able to do all of my own housework. Because of the good Postum did us I knew that what you claimed for Grape-Nuts must be true and we have all used that delicious food ever since it first appeared on the market.

"We have 7 in our family and I do the work for them all and I am sure that I owe my strength and health to the steady use of your fine cereal food and Postum (in place of coffee.) I have such great faith in Postum that I have sent it to my relatives and I never lose a chance to speak well of it." Name furnished by Postum Co., Battle Creek, Mich.

Ice cold Postum with a dash of lemon is a delightful "cooler" for warm days.

The Distribution of Skim Milk.....

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

A Problem in Ventilation.

Remodeling a Stone Barn.

ED. HOARD'S DAIRYMAN:—Enclosed find subscription to your most valuable paper. Frequently find an article worth many times the price of year's subscription. We have completely remodeled our barn with the exception of placing ventilators. The barn is an old and very substantial stone structure, double decker and accommodates thirty-two cows; horses in an entirely separate, though connected, building. Our ventilators must be placed with the next two weeks, and any information thereon in your next issue, if possible, would be greatly appreciated. Owing to thick stone wall, they must pass up through hay bays and they are now entirely empty and ready for carpenters. How near floor must ventilator extend that carries off foul air? how high? It is 30 feet to square of barn. And how can I best place opening to fresh air inlets? Don't want to penetrate stone wall. Barn 35x72 feet, entry on each side, sixteen cows in a row, standing back to back, with an abundance of room. Each cow is automatically supplied with fresh, pure water, has large, easy, roomy stanchion, dry floor, but we must have pure air. I am sorry I left writing so late, but trust to hear from you promptly, that I may avail myself of your knowledge and experience.

Pineville, Pa. H. A. W.

In the absence of a sketch showing the the general arrangement of this barn and stable, we can do no better than submit some general suggestions in regard to a plan for ventilation. The ventilating flue proper may be located almost anywhere, so that it is as much out of the way as possible. For 32 cows, it should have a cross section of about 7 square feet, or there may be two of these flues, each with a cross section of four square feet. This flue should extend from the level of the stable floor above the ridge of the barn—not necessarily through the ridge, but with its top higher than the ridge of the barn so as to prevent a downward draft. It should be built and used exclusively for ventilating purposes, and not, as is so often the case, for the double purpose of drawing off the foul air and furnishing a chute for delivering hay from the upper stories. In other words, it should be built and operated on the same plan that chimneys are built. There should be openings into this flue on a level with the stable floor, and these not so much for furnishing an outlet for the vitiated air, as for drawing off the colder air of the stable, which is always at or near the floor. There should also be openings in, to these flues near the ceiling of the stable for use in summer to allow the heated air of the stable to escape. All openings should be furnished with some sort of appliances which may be opened and closed, in whole or in part, at will.

The more difficult part of the problem of ventilating this stable is in the admission of fresh air without making openings through these heavy stone walls. Ordinary windows are not adapted for this purpose, because they are quite as well suited for letting the warm air out ot the stable, especially in winter time, as for the admission of fresh, pure air. In building a new stable, or in remodeling an ordinary frame barn, it is comparatively easy to provide for the admission of fresh air by constructing several small flues in the side walls, opening interiorly at or near the ceiling of the stable and exteriorly three or more feet lower. By having the exterior opening lower than the interior opening, it is impossible for the warm air at the top of the stable to escape. As it is impracticable in this case to pierce the wall for these several small openings, the only recourse would be to construct one or more large ducts opening outward into descending flues, reaching well towards the ground and running horizontally along the ceiling with occasional openings into the stable.

In short, the plan is to provide for the introduction of fresh air into the stable at several points along or near the ceiling and in such a way that the warmer air of the stable cannot escape. In this way, the fresh, cold air is evenly distributed all through the stable, comes in contact with the wamer air at the ceiling and gradually finds its way downward to replace the foul and cold air at the bottom, which is drawn off through the ventilating shafts. It involves precisely the same principles that were operated in the dwellings of our ancestors, when the large, open fireplace, with its big chimney was the only means employed for heating the dwelling. Unlike our modern structures, those houses were not air-proof and the fresh, cold air sifted through the walls and windows in innumerable places, in sufficent quantity to supply the demands of the large chimneys. In some ways, those old houses were not as comfortable as the modern stove or furnace or steam heated apartments of our day, but there was plenty of fresh, pure air and no accumulation of dead and foul air in the rooms. The result was that our ancestors were a healthy, rugged race and could endure exposure and hard labor much better than their descendants of the present day. In like manner, if we want a healthy, rugged herd of cows, that can make the best use of their food and furnish us the highest quality of milk, we must provide for constant change of the atmosphere in our stables, and this in such a way, as to distribute the fresh air evenly throughout the stables, by drawing off the the colder and impure air at the floor after the manner in which the old-fashoned chimney ventilated the old-fashioned house.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

Wetting Top of Silage.

In one of your issues last year you requested some of your subscribers who had silos, after filling the same, to wet the material on top very thoroughly several inches deep, and report results to the DAIRYMAN. I am very anxious to know whether the experiments were made and if they were what was the result. I would also like to know whether it is desirable or beneficial to sprinkle, with salt water, the silage as it is filled in. R. W. W.

Washington, N. C.

Several parties reported wetting the top of the silage and uniformly with good results. Unless the corn is over-ripe, there is no necessity for wetting the silage as it is delivered from the cutter into the pit. When frosted or over-ripe it is desirable to use enough water to insure a rapid heating of the mass. We do not consider it advisable to use salt in the silo.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The Elgin Board Meeting was largely attended today. The Quotation Committee decided on 20c firm as the market price. One-hundred and fifteen tubs were offered; 55 sold to Moles for 20½ cents.

Flavor

The market value of butter is unquestionably its flavor, and its flavor is unquestionably affected by the quality of the salt used. Prize winning butter makers always use DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—to insure that *winning flavor*. Its pure, dry flakes quickly dissolve—assimilate *evenly* through the butter, and add a keeping quality that is inestimable. No waste—no grit—no mottled effect. The only salt in the world that's all salt. Dairymen will find our illustrated booklet "Just Salt" contains valuable hints. We send it free.

BALTIMORE MARKET.

BALTIMORE—June 25—Butter— With continued liberal receipts and favorable reports from the principal dairy sections for a large output of butter, there is not that activity that characterized this market a short time back, although the local consumptive demand continues fairly good, and jobbers are readily taking their regular lots: there is very little speculation, consequently several lots have gone into the freezers on shipper's account; toward the close of to day's market, there were several buyers on the lookout for the long lines of fancy creamery, and several sales were affected at top values Imitation creamery, although in more liberal receipt, the supply of desirable quality is not at all burdensome. Madles—The supply is daily on the increase; only faultless stock will reach our top prices. Packing stock—The receipts have been increased considerably since our last issue, and prices had to be lowered to prevent the stock accumalating. Prints and Blocks—The receips are fully eaqual to the requirements. The market in general, while on the quiet order, closes steady to firm on all attractive offerings.

Creamery Separator, extras, 22½c; firsts, 21½@22c; seconds, 19@21c. June Creamery, extras, —@—; firsts, —@—; seconds, —@— Imitation Creamery, extras, 19@19½c; firsts, @18c; seconds, 15@17c, Iowa &N. Creamery blocks (2-lb.) extras, 23c; firsts, 22c. seconds, 20@21c; Creamery prints (½ lb) extras, 24c, firsts, 22@23c; seconds, 20@21c. Md. Va., & Penna. Prints, extras, 22c; firsts, 20@21c; seconds, 17@19c. Renovated Butter, extras, 19@20c; firsts, 17@18c; seconds, @16c.

Eggs—We have had a continued irregular market since our last issue; this is owing to the ample receipts and a less active demand, hence there is an easier feeling and prices had to be lowered to prevent the accumulation of stock that showed signs of tonderness; strictly fresh stock is always saleable at top prices. The market closed at 16½c

NOTE—Pack in cases and not in barrels an boxes.

Cheese—The receipts are fully equal to the requirements; the market rules quiet but firm.

NEW YORK MARKET.

NEW YORK, June 27.—Butter—Receipts for the week, 66,561 packages. Exports for the week, 25 packages.

Receipts are largely in excess of the corresponding time one year ago, and prices fully as high; then, as now, prices were pegged up at a price far above its worth and put into "Freezers" entirely on speculation. Last year there was no profit in June and July butter and August and early September makes sold at the lowest prices of the entire year. Will the coming summer be a repetition of last year?

There were free sales of Extra Fresh Creamery, but there was more than enough to go around, and large blocks were put into Cold Storage for account of receivers. Firsts were offered at 20½@21c, and under grades at 18@19c.

At the close there was more Creamery Butter offering, and a general feeling that prices must go lower if present heavy receipts continue. Selections of finest New York Dairy tubs sold readily at 20c: bulk of arrivals, however, were poor stock packed in all kinds of sizes of packages and sold at 16@18c. Ladle goods were more plentiful and prices easier. Renovated only salable in small way and for very finest quality. We quote:

Creamery, extra, 21c; medium, 20@20½c; poor, 15@19c; Dairy, extra, 20c; medium, 17@19c. Poor, 15@16c.

Chese—Receipts for the week, 37,419 boxes. Exports, 13,734.

Home trade and exporters took all the fancy goods that were offered and paid 10⅞@11c, but there were only a few sales at the latter price. Many of the finest factories arriving this week were stored in freezers for later markets. Good grade skims sold readily at 5@7c; while fancy makes were quickly taken at 8@9c. We quote:

Full cream, extra, 10⅞@11c; medium, 10@10¾; poor, 8@9½c.

Eggs—Receipts for the week, 65,201 cases.

Fancy marks sold readily on arrival at full prices. Ordinary grades continue abundant and freely offered We quote:

New York & Penn., strictly fancy, per dozen, 19c; Northern & Western, strictly fancy, 18@18½c; All sections poor to good, 13@17c.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Wanted—A first-class single man, not under 30 years of age, to work with a business dairy herd. Must understand rearing of young stock, be good milker and of good habits Permanent position to right party. References required. Address O. K., care of HOARD'S DAIRYMAN.

Wanted—First-class single man who thoroughly understands the work of retail deliveryman on milk route. Must be steady and of good habits. Permanent employment to right man at living wages. References required. Address MILKMAN, care of HOARD'S DAIRYMAN.

To a conscientious, energetic, up-to-date dairyman, who knows the meaning of the word "clean", can furnish his own horses, wagons, and tools, and will raise my calves, I will furnish, with no other charge for rent, a good dairy farm and herd, with silo and power, and will buy his milk at $1.15 per cwt. Or will consider giving interest in business. Correspondence invited. Address F. M. POWERS, Atlanta, Georgia. 20-2

For Sale—3 Reg. Holstein Bulls 1 yr. old. Also few heifers. FRANK BREWSTER, Bowers, Wis. 20-2.

For Sale—A second hand, self-feeding, 16 inch Smalley Ensilage Cutter in good order, together with 56 feet of carrier, 18 feet of which was new last year Also a three horse Smalley Tread Power in good condition. The above will be sold cheap to make place for larger machinery. W. D. HOARD, Fort Atkinson, Wis. 20-tf.

For Sale—First-class dairy farm of 256 acres, one-half mile from city limits of River Falls, Wis. 245 acres in crop and pasture; balance woodland. Fine buildings, creek and spring with milk-house. Call, or address the owner, MARTIN MURPHY, River Falls, Wis. 21-4

For Sale—One 6 month old Jersey bull calf, pure bred, well marked. Price on cars $30.00. Enquire W. H. RODDIS, of Roddis Veneer Company, Marshfield, Wis. 21-2

Wanted—Practical and experienced man in creamery and dairy work. Must be capable of taking charge plant and men. Apply PEOPLES ICE COLD STORAGE CO., McKeesport, Pa.

For Sale—Milk route, horses, harness, wagon, separator, cans, tickets, etc. A nearly new and very complete outfit. Present net earnings about $150.00 per month. A splendid business opportunity. Apply to JOHN L. FISHER, Hayes Block, Janesville, Wisconsin. 21-3

Wanted—An experienced man to work on small dairy. Married man with small family preferred. State wages expected in your first letter and give references. Must be an all-round man. L. O. HAMILTON, Barron, Ill.

Will Sell gr. son Stoke Pogis and Ida of St. L. Dam tested 17 lbs. 4 oz. E. W. MOODY, No. Andover, Mass. 21-2

Wanted—Married man with one boy old enough to milk, to work in an up-to date dairy; commence work Sept. 1. Good house surroundings and wages to proper parties. Write A. H. BARROW, Roodhouse, Ill.

For Sale—From Angelius Herd Guernseys—3-year-old bull "Befillius", a beauty of the best blood from Wisconsin, $125.00 f. o. b. Also bull calf out of Countess Lonan by Befillius, $50 00. W. W. MARCH, 1798 W. 39th St., Los Angeles, Cali. 20-2

217-221 Drumm St., SAN FRANCISCO.

GENERAL OFFICES:
74 Cortlandt St., NEW YORK.

121 Youville Square, MONTREAL.
75 & 77 York Street, TORONTO.
248 McDermot Avenue, WINNIPEG.

For Sale—Dairy farm consisting of 76 acres. Also the entire stock of well bred young dairy cows and heifers, all in good condition. Call on me at farm, close to R. R., 1 mile north Mechanicstown Station, or write to N. E. KIMBALL, Mechanicstown, O

For Sale—Two granddaughters of Exile, 20 and 21 mo's. old; served. 3 solid color St. Lambert bulls. Three 4 and 6 mo's. old, sire a double Gr. son of St. Lambert Boy sire of 54 tested cows. J. A. HERR, Lancaster, Pa. 21-4

For Sale—One De Laval Separator; one Star Milk Cooler; one Receiving Vat; one heating Weigh Can, 60 gal.; Six Horse-power Boiler; one 100 gal. Potts Pasteurizer. All as good as new. DALLASTOWN CREAMERY CO., Dallastown, Pa.

For Sale—One 100 lb. Embree Worker; one 150 gal. Reid Box Churn; one 1000 lb. De Laval Separator; one 8 horse power engine and boiler (on wheels). Address JAMES S. BIGGS, Rocky Ridge, Md. 19-4

A Registered Guernsey Bull 15 months old for sale. A very fine animal. Inquire of J. S. HUNTER, Pickett, Wis. 12-tf

Fine Dairy Farm for Sale—Near St. Paul, Minn. 210 acres good land with ample buildings of all kinds. Page fence. cedar posts. Pure bred Holstein cattle and Yorkshire swine sell readily at good prices. Good markets for all dairy products. Will sell with or without stock and other personal property. Easy terms. Enforced removal to California only reason for selling. T. S. TOMPKINS, Pasadena, Cal. 15-tf

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

Wanted—Single man on large dairy. Only good milkers need apply. F. W. ADAMSON, Lake Bluff, Ill. 4-tf.

Wanted—Position in dairying business by single man (38) familiar with Babcock test, Buttermaking, Separators, Boilers and Engines, etc. Also the care and feeding of dairy cows. Address D-5, care of HOARD'S DAIRYMAN. 20-tf

Wanted—An up-to-date man of 20 years experience wants to rent a good sized dairy or stock farm, with stock, up-to-date buildings and equipments, tools, teams, etc., or will accept position as manager. Understand all machinery to run an up-to-date farm or dairy. Married and have family. Adr. "Van" General Delivery, Sleepy Eye, Brown Co., Minn. 20-tf

Wanted—Two good single men at $35.00 per month and board. Higher wages in harvest. Also one or two experienced milk maids $5.00 per week. State experience. L. TUTTLE, Verdi, Minn. 20-2.

Very Low Excursion Rates to Boston, Mass—Via the North-Western Line. Excursion tickets will be sold June 30 to July 4, inclusive, limited to return until July 12, inclusive, with a special return limit by extension until Sept. 1. on account of N. E. A. annual meeting. Variable routes. Stop-overs allowed at Detroit. Niagara Falls, Philadelphia, Baltimore, Washington and other specified points. Apply to agents Chicago & North-Western R'y.

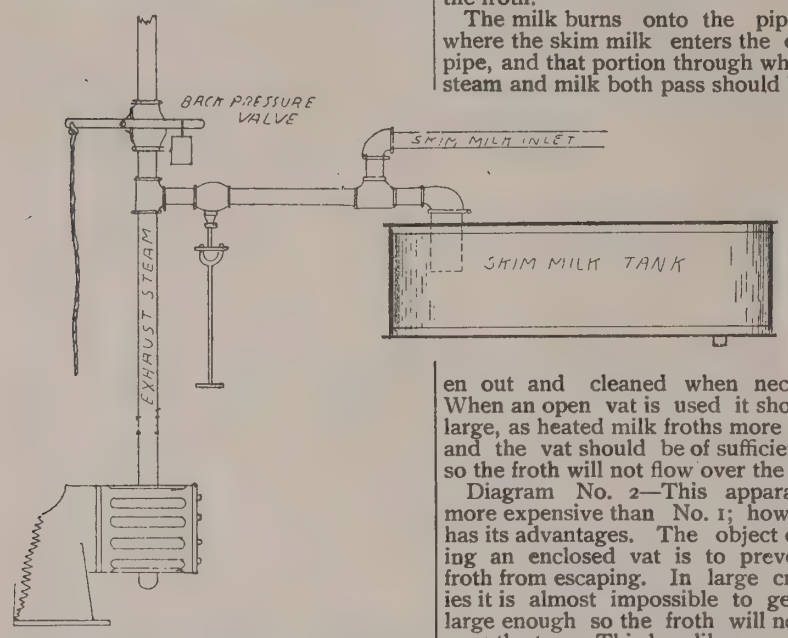
Very Low Rates to Atlanta, Ga.—Via the North-Western Line. Excursion tickets will be sold July 5, 6 and 7, with final return limit by extension until Aug. 15, inclusive, on account of B. Y. P. U. Annual Convention. Apply to agents Chicago-North Western R'y.

Special Excursion Rates—The North-Western Line will sell low rate round-trip tickets to Fond du Lac and intermediate stations, good every Sunday until Sept. 27, 1903. Apply to agents Chicago & North-Western R'y. 21-7

Low Rates to the East—Particular attention is being called by the Chicago & North Western R'y to low rates which have been made for meeting of the National Educational Association at Boston, next month. These round trip excursion rates with liberal return limits are available at a time of the year when teachers, students and others are making their plans for the summer vacation, and afford an excellent opportunity for a journey to one of the most interesting cities in the world, as well as reaching the seashore and mountain resorts of New England. Parties are being formed at various points in the west for the purpose of making this journey in congenial company. The officials of the Chicago & North-Western advise that the movement as now anticipated will be very large. For particulars apply to ticket agents Chicago & North-Western R'y.

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

Very Low Rates to California and Return—Via the North-Western Line. First-class round-trip tickets on sale July 1 to 10, inclusive, to San Francisco and Los Angeles. Favorable limits and stop over privileges and choice of routes. The overland limited, most luxurious train in the world, leaves Chicago daily at 8 p. m. Less than three days en route. Drawing room and compartment cars, observation cars, dining cars, buffett-library cars (barber and bath), electric lighted throughout. Three trains a day from Chicago to the Coast through without change. Daily and personally conducted tourist car excursions to California, Washington and Oregon. For particulars apply to ticket agents Chicago & North-Western R'y. 16-7



Fourth of July Excursion Rates—Via the North-Western Line. Excursion tickets will be sold at low rates to points on the North-Western system within 200 miles of selling station, July 3 and 4, good returning until July 6, inclusive. Apply to agents Chicago & North-Western R'y. 20-3

Very Low Rates to Denver, Colorado Springs, Pueblo and Return—Via the North-Western Line, July 1 to 10, inclusive, with final return limit until and including August 31, 1903, account of C. E. Convention, Stop over privileges and choice of routes. Side trips can be made at reduced excursion rates to various Colorado points, to the summit of Pike's Peak, to Ogden and Salt Lake City, (to Yellowstone National Park, from Denver, only) and to San Francisco, Los Angeles, etc. Low rate excursion tickets to Colorado also on sale daily, limited for return until Oct. 31. For particulars apply to ticket agents Chicago & North-Western R'y. 20-3

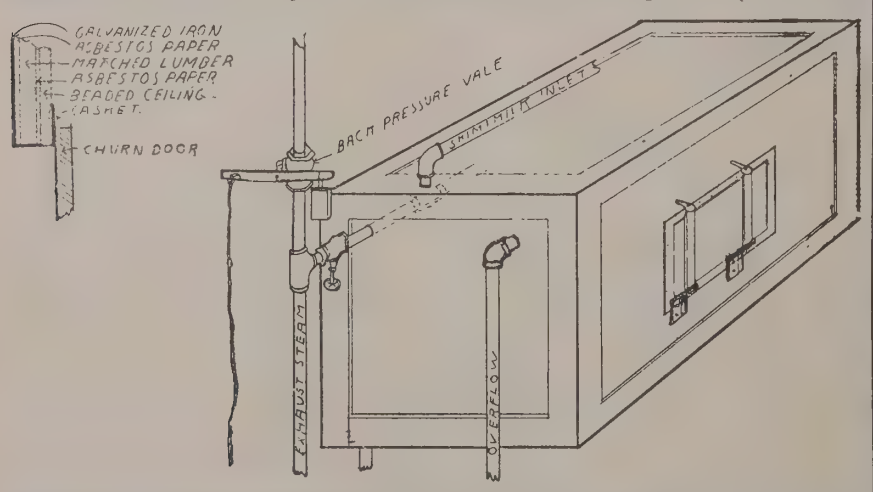
Pasteurization of Skim Milk.

The skim milk returned to the patrons by some creameries, has been a serious problem, and farmers have sustained thousands of dollars of losses since the establishment of the creamery industry in the state. Experiments have conclusively proved that skim milk, which has been allowed to become sour, is reduced in value for feeding to any kind of stock, at least five cents per hundred pounds. During the year 1901, at least one billion pounds of skim milk was returned to the patrons of the creameries in the state, and, if it had all been returned in poor condition, it would have been a loss to the patrons of at least half a million dollars, not counting the loss of calves and pigs killed by the feeding of poor milk; but fortunately a good many creameries have pasteurized (heated) the skim milk and delivered it to the patrons in the best possible condition.

We have seen some creameries make an attempt at pasteurizing the skim milk, but only heated it to a temperature of 130 or 140 degrees F., at which temperature only a few, if any, of the fermenting bacteria which cause the sour-

ing of milk were killed, but instead the milk would soon cool down to a temperature where the bacteria would multiply more rapidly, and the result was sour milk before the farmer reached home, and the people would say pasteurization was a failure. "They tried it," but the fact is, the milk was not pasteurized at all, but simply warmed.

Denmark, the little country which is turning out so much fancy butter, and is practically the only competitor the United States has in England, reached a point quite a number of years ago, where the country was threatened with the annihilation of their cows by the much dreaded disease, tuberculosis, and as a result, they took up pasteurization of the skim milk, and have had a law for several years, compelling every creamery to pasteurize the skim milk at a temperature of 185 degrees F. before it is returned to the patrons. The creamery inspectors are furnished instruments by which they can tell whether or not the milk has been heated to the required temperature, even after it has been cooled. If it is found that it has not been heated properly, the creameryman is prosecuted. We have been informed that tuberculosis there is being rapidly stamped out. The farmers do not feed the calves any milk which has not first been pasteurized.



From the tests which have been made in Minnesota of cows, it was found that tuberculosis prevails almost everywhere, and we ask, is it not about time for the farmers to protect their stock against such a disease? The new law enacted by the legislature, at the session just closed, requires that all skim milk from creameries must be pasteurized at a temperature of 180 degrees F. If this law is complied with, it will benefit the dairymen of Minnesota hundreds of thousands of dollars. The Dairy and Food Commission is willing to assist the creameries, when asked, by sending men to help install the necessary apparatus for heating the skim milk. The diagrams shown, illustrate the simplest and cheapest contrivances we know of, and will do the work satisfactorily.

Diagram No. 1 illustrates the arrangement of piping for pasteurizing skim milk. This is so simple that it needs no explanation, and will only say that the length of pipe from where the milk is admitted should be two or three feet long, and the pipe which extends into the skim milk vat should be twice the size of the exhaust pipe, as it breaks down some of the froth.

The milk burns onto the pipe from where the skim milk enters the exhaust pipe, and that portion through which the steam and milk both pass should be taken out and cleaned when necessary. When an open vat is used it should be large, as heated milk froths more or less and the vat should be of sufficient size so the froth will not flow over the top.

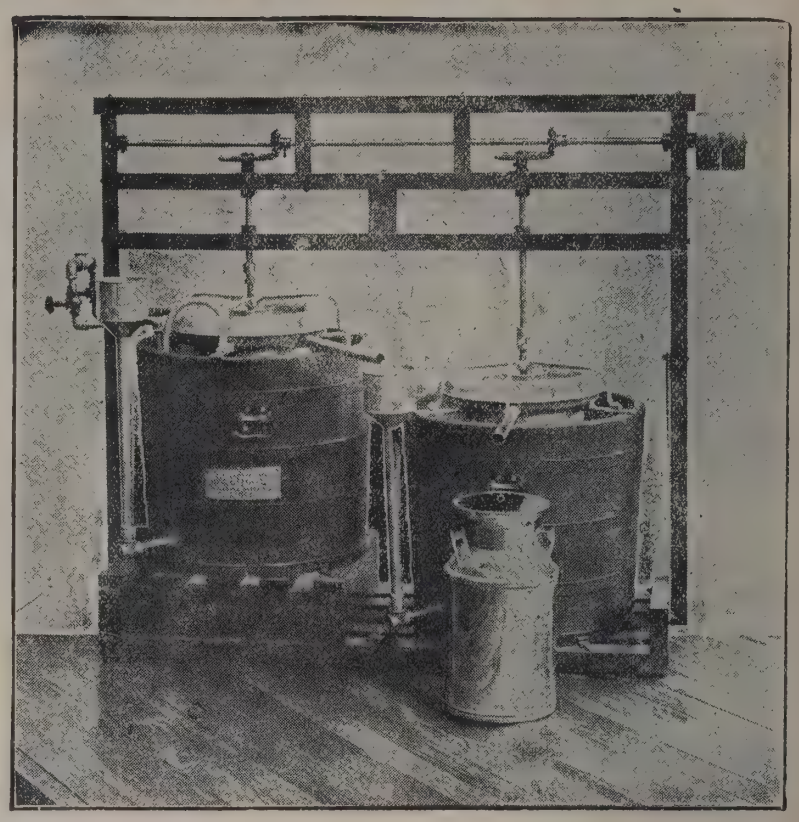


Diagram No. 2—This apparatus is more expensive than No. 1; however, it has its advantages. The object of having an enclosed vat is to prevent the froth from escaping. In large creameries it is almost impossible to get a vat large enough so the froth will not flow over the top. This box-like apparatus is not a pasteurizer, but simply a tight vat to hold the milk after it is pasteurized. This is similar to the one constructed by E. O. Quinvold, which is giving such excellent satisfaction at the Crown Creamery in Steele county.

By the use of this diagram it should not be difficult for any mechanic to make such a vat quite easily. It is simply a box of any desired size, made from galvanized iron, covered, first with asbestos paper, then with matched lumber (medium grade of flooring will do), then another thickness of asbestos, and then with beaded ceiling. It could be made with only one thickness of abestos and beaded ceiling, but the double thickness makes the vat stronger and there will be less radiation. A common churn door, which may be taken from a discarded churn, which should be riveted and soldered to the galvanized iron on the side of the vat, makes an excellent door of sufficient size so a man can get into the vat to wash it, which should be done, and the vat kept clean.

The exhaust pipe should be fastened to the vat by the use of a flange riveted and soldered to the galvanized iron, and the threads on the pipe cut long enough to

A GREAT SUCCESS.

The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the Buhl Factory, "Improved Elgin" and Genuine Iowa Cans; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

reach through far enough so a tee may be put on the inside of the vat and a piece of pipe two or three feet long put into the tee. The skim milk pipe should be extended through a flange on the top of the vat into the tee. The flange should be riveted and soldered the same as the ones for the exhaust outlet and overflow pipes. The overflow pipe should be a little lower than the exhaust pipe.

The milk will burn onto the pipe from which the skim milk enters the exhaust pipe, and that portion of the pipe through which the steam and milk both pass should be taken out and cleaned when necessary. The exhaust or milk pipe should not be reduced in size, for these or any other pasteurizers.

W. W. P. McCONNELL,
Minnesota Dairy and Food Commissioner.

Putting up Alfalfa in the Stack.

I have lately been reading a number of very interesting articles regarding the stacking of alfalfa, and while I am not averse to them as a whole I would like to give an account of my system. I stack several hundred tons annually, using the Fleming swinging stacker and two Fleming senior sweeps or go-devils, carrying the hay ahead of the horses and taking it direct from the windrow. I drive lengthwise of the windrow, zigzaging so as to fill the sweep full length, then shove some ahead, raise the load over and let down on top; back up, chug in again fast and this piles the hay six feet high, checking one horse so as to pull out of the windrow, at the same time raising the load. In this way the load is carried direct to the stacker, driving square up to the pitcher and dropping the load thereon. Then I back off, wheel half way around by starting one horse and backing the other and go for another load.

The stack-tender gathers the trip-rope and pulls back the rope in the left hand, leaving the trip-rope loose and starting the horse with the right hand. The horse is trolleyed to the guide rope running through a ring fastened to the bit by a short strap to keep him in place and to stop him when the stacker is swung high enough. As the horse moves the load rises and swings toward the stack. The driver holds by the pull back rope, changing the loose trip-rope into the right hand. If he wishes the load on the near side of the stack as soon as it clears he commands the horse to stop and hold there, at the same time loosening his hold on the back rope a little. If the stacker has been properly adjusted gravity will swing the load wherever the stacker wishes it and it is then tripped. The pitcher teeth strike the stack, the load remaining partly on them.

Then the horse starts again to draw the pitcher out, letting the load down on the near side of the stack beautifully. The pitcher snaps up into position and locks. The driver then pulls it back by the rope, backing the horse ready for another load, while the stacker climbs onto the load and settles it into position and leans on his fork ready for the next. When the next load comes up, the builder possibly wants it dumped on the off side of the stack. Then we manage differently, by letting the horse pull the load up high above the stack. When swung to proper place with the horse kept going we trip, which throws the load bottom side up, on the far side of the stack. The horse soon learns to stop when it is time to trip and backs right up. The stacker must be alive and pull the stacker back quickly into position.

This makes a stack from sixteen to eighteen feet wide, thirty-five feet long and twenty-three feet high without moving the rig. It can be topped out a little higher by taking hay directly off the pitcher and throwing it back. The hay coming on the stack in this way in 500 to 600-pound jags and dropping on the top without being loosened makes a very solid stack. All the leaves remain in the hay, if rains have not already spoiled it. I have stacked eighty-three tons in two days with a full outfit—four men and five horses—the hay being measured after thirty-days' settling. I usually stack in the middle of a ten-acre field, joining two stacks together, if necessary, making a rick from fifty to seventy feet long, stacking the second crop by the side and the third by that, etc. It takes no more room to stack in the field than in a stack yard, therefore I raise alfalfa in my stack yard. Of course do not get a crop where I stack but use the same place each year, hauling in winter to the feed lots.—E. C. Scriven in *Field and Farm.*

"1900" BALL-BEARING WASHER FREE

FROM FACTORY TO YOUR DOOR.

FREIGHT PREPAID BOTH WAYS ON 30 DAYS FREE TRIAL.

No Deposit or Advance Payment Required. If Not Satisfactory, Return it at Our Expense. No Questions Asked.

The "1900" BALL-BEARING Washer is the greatest time, labor and expense saving appliance ever invented. An absolute necessity to Households, Laundries, Hotels, Boarding-Houses, Public Institutions, Etc. Only practical, simple, easy-running washer ever made. Hundreds of thousands now in successful use.

The "1900" Ball-Bearing Automatic Washing Machine is the simpliest, easiest running, most efficient machine for washing clothes ever invented. It is a thoroughly practical labor-saving machine for washing all kinds and grades of materials, from the finest laces to the coarsest fabrics. It is constructed on scientific principles. It revolves on ball-bearings, which render the rotary movement as easy as the wheels on a high-grade bicycle. The "1900" Washer will wash any garment without boiling, without scrubbing and without wear or tear. There is absolutely no need of using any chemicals. Soap and hot water are the only necessary things to do perfect work.

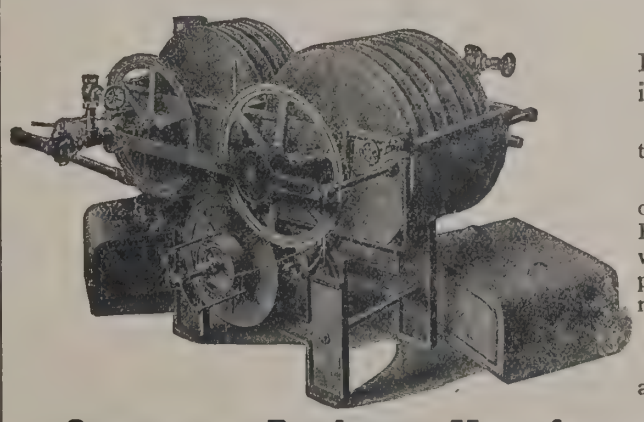
The Washing is Done while the Operator Sits by the Side of the Tub, Revolving it by the Handle halfway around to right and left.

CONVINCING TESTIMONY.

$1,000 Will Be Forfeited to Anyone Proving These Letters Not Genuine.

Burnside, Iowa, April 1, 1903.
My wife is delighted with the Washer we got in January. **Would not part with it for $1,000 if she could not get one like it.** The day she formerly dreaded she now enjoys! Does not become tired of the wash and has **no backache any more.** We therefore both appreciate very much your kindness in sending us the liberal proposition through which we became owners of one of your "1900" Washers. Yours thankfully,
REV. A. E. GUSTOFSON and Family.

Dennysville, Mo., March 25, 1903.
Find enclosed **for full payment for "1900" Washer,** for which send me receipt in full. We have tried it for all purposes and am well satisfied that it will do all that you claim it will. Today we have done a large wash for a family of ten and had it all done and **on the line in just two (2) hours;** used to take me until after dinner the old way. Shall recommend it to my friends whenever a chance occurs. CHAS. H. DUDLEY.



REMEMBER—You take absolutely no risk, incur no expense or obligation whatever. The Washer is sent by us on 30 days' trial, freight prepaid both ways, and positively without any advance or deposit of any kind.

For catalogue and full particulars of this liberal and absolutely genuine offer address

What Caused the Shrinkage in Milk?

Feeding Pigs for Profit.

ED. HOARD'S DAIRYMAN:—Through the columns of your much appreciated paper we will ask for needed information. In this section of Vermont we all thought our troubles over when the drouth was broken, but the end is not yet. My cows during the dry weather did very well in keeping up a full flow of milk. They had 20 lbs. ensilage and a mixture of corn and oats from two to four lbs , and bran one to two lbs. At same time were on pasture, too dry for anything we thought. Since the rains they have shrunk nearly one-third in milk. We fed the last of silage today. Will have an abundance of peas and oats soon. Shall feed hay until they are ready to cut, and cut off the grain ration. It doesn't seem to pay to feed it. We can't get cotton seed or oil meal. Can you suggest any ration that ought to bring them back to their milk and at same time be profitable for 19-cent butter?

I have five acres peas and oats. They were divided into plots and sown in successive sowings so as to provide green feed, but dry weather prevented the growth so they will all be ready about same time. Should you advise cutting into silo or haying them, and at what stage should you cut so as to get the most digestible food? When we cut and hay them when in the "milk" stage, the cattle leave a large amount of the straw and do not seem to relish them as when cut earlier.

How late in the season may we seed for alfalfa? I have been waiting for some of our progressive farmers to try it, but I guess I shall have to start the ball rolling.

We have 16 young pigs about 5 weeks old. Will you please give me a ration that ought to give a profit from start to finish? They are confined in pens, kept dry. We cannot pasture them, as we draw muck and horse manure to make all the manure we can from the skim milk. Corn meal, $1.25; middlings, $1.35; bran, $1.20. P. J. H.

Johnson, Vt.

It is impossible to say what caused this abnormal shrinkage in milk, unless it was that the fresh growth of grass after the copious rains afforded very little nutriment. The proper thing to have done when this shrinkage was first observed, would have been to increase the allowance of grain so as to hold up the milk flow at all hazards. It is not altogether a question as to whether the daily yield of milk will pay for the feed, but consideration should be given to the future. When a shinkage in milk becomes well established, it is practically impossible to bring the cows back to their normal flow, no matter how they may be fed. Therefore, though the grain fed today may not produce milk enough to pay the cost, yet the cost will be repaid in the future.

Oats and peas do excellently well in the silo, but we should prefer to make them into hay if there is a prospect of corn enough to fill the silos. Cut for hay a little earlier than the milk stage. The proper time is when they are in blossom, the same as we cut clover and timothy hay.

It is not yet known how late in the season alfalfa may be seeded in the climate of Vermont and Wisconsin. As yet, we cannot advise seeding alfalfa except in the spring. It needs to get a good, strong root growth to carry it through the winter and the following spring.

According to the tables given in Prof. Henry's work on Feeds and Feeding, pigs weighing from 30 to 40 pounds, should have a daily allowance of 4½ pounds of skim milk with 1½ pounds of corn meal, or middlings, or a mixture of both. When weighing from 70 to 80 pounds, increase the milk to 7 pounds and the grain to 2¼ pounds. When the weight increases to 120 pounds and over, increase the milk to 9 or 10 pounds and the grain to 3 or 3½ pounds. At 175 pounds in weight, give 12 pounds of skim milk and four pounds of grain.

These figures are only general suggestions and should not be followed blindly, but the feeder should watch the developments and be governed largely by them; feeding more or less as circumstances seem to require.

The Curing of Hay.

Since the hay crop is likely to be light this year, it is doubly important that it be handled to the best possible advantage and cut and cured in such a way as to secure the largest amount of nutrients in the most digestible and palatable form.

To this end it is well at this season to bear the following facts in mind: Early cut hay is relatively richer in flesh-forming elements; it is more palatable and digestible; it has a sweeter aroma; but it has the disadvantage of being much more difficult to cure. Grass as it approaches maturity, gains considerably in weight, part of this increase consists of starch and sugar, which is valuable to the feeder; and part consists of crude fibre which decreases digestibility and renders the hay less palatable. Early cut hay is more valuable per ton than late cut; but a larger amount of digestible nutrients per acre is obtained by later cutting. Late cut hay has also the advantage of being more easily and rapidly cured, thus diminishing not only the labor, but also the risk of loss in harvesting.

Early cut hay is especially valuable for sheep, calves, colts, and dairy cattle; while for fattening cattle, late cut hay will give as good results. In experiments conducted by Prof. Sanborn of New Hampshire, and Prof. Henry, of Wisconsin, to determine the relative value of early and late cut hay for fattening steers, the advantage was a little in favor of the late cut hay.

Whether hay should be cut early or late will depend, therefore, on the following conditions: 1. The stock to be kept; at least enough hay should be cut early to supply the dairy cows and young stock. 2. The season; if the weather be "catchy" it is generally wiser to defer the cutting until somewhat later. 3. The acreage to be handled; if the crop be large, it will be necessary to begin cutting earlier.

By earlier cutting is meant cutting at or before the time of full bloom. By late cutting is meant cutting between the time of full bloom and ripening. In any case, however, hay should be cut before it is ripe enough for the seed to shell readily. A crop of mixed clover and timothy hay is at its best if both quality and quantity are to be considered, when from one-third to one-half of the clover blossoms have turned brown.

Hay should be cured and stored as rapidly as possible after cutting. With this in view, it is better to defer cutting in the morning till most of the dew is off. If 30 tons or more of hay is to be handled in a season, a tedder will be found a good

"COME in the evening or come in the morning, when you're looked for or come without warning"—You'll always find your Tread Power ready for business. OF WHAT OTHER FARM MOTOR—Wind Steam or Gasoline—can this be said? A PERFECT GOVERNOR ensures absolutely even speed. Send for free catalogue.

CLINTON, Waukesha, Wis.

BIG MONEY IN OIL!

Better than Wheat, Corn or Bank Stock. Others have grown rich from Oil. Why not you?

We own 15,000 acres of choice oil lands at Fossil, Uinta County, Wyoming, worth $1,000,000. Our capitalization is 2,000,000 shares; par value $1 each. Value of our stock is estimated at $1.35. You can get some of it, if you write soon, at a flat rate of only 20c per share. Our fields will prove the best in America.

The character and financial standing of the men behind this enterprise will bear the closest investigation. Our property has been examined and reported most favorably upon by the leading geologists, chemists and practical oil men of the west. Their endorsement has already led to large investments by reputable financiers in many parts of our country. This low rate is open to you for a short time only. This is no speculation but a safe business proposition.

An investment now may bring you a fortune. The Pacific Oil Reporter of San Francisco, for June 6th, a very high authority on oil wells, by the way, declares that our company has splendid prospects. If you are interested and will write to us we will send you unquestioned proofs of the reliability of our investment and satisfactory references.

As a pointer, we will state that 150,000 shares were sold in only five months. It will pay you to look into this proposition and it will cost you nothing to write us for particulars

instrument. Care must be exercised to avoid storing hay while at all damp from rain, dew, or absorption from the ground. Moisture of this kind will spoil hay much quicker than the water contained in its own sap.

Last year attention was called to the method of curing clover hay practiced successfully by Mr. Herny Glendenning, and a number of other prominent and reliable farmers. Mr. Glendenning thus outlines his method: Cut when in full bloom, or when the blossoms contain the most honey. Cut in the morning after the dew has dried off. That cut in the morning may be cocked up in the afternoon. The mower should not be run later than 4 p. m., and all cut that day should be put into cock before the dew falls. This hay should be put into the barn next day and well tramped into the mows. He especially emphasizes the following conditions:

1. Do not cut in the morning until the grass is dry.

2. Do not allow fresh cut hay to lie on the ground over night, exposed to dew or rain.

3. If any hay should get wet with rain, let it stand in the cocks until thoroughly dry before taking to the barn.

Mr. Glendenning states that his hay came out as green as when it was put in, with the blossoms a beautiful pink color, which would indicate that it had not heated so much as one would naturally expect.

The advantages of this method are: 1. The saving of time between cutting and storing, lessening the risk of damage from rain. 2. All leaves and blossoms, the most valuable part of the plant, are saved. 3. The hay is cleaner and brighter than that cured in the old way.

Of course the hay cannot be cured by rule; conditions vary. A good method of curing on a gravelly upland farm would be quite unsuited to the flatter clay and humus soil.

The length of time for which hay should be exposed in the swath will be determined by its ripeness, by the humidity of the atmosphere, the temperature and moistness of the soil, the presence or absence of wind, etc. So that every man must be, in a large measure, a law unto himself, and his practice must be governed by personal experience.

It appears to be a fact, however, that when the conditions are favorable, and the necessary skill and judgment exercised, clover may be stored much greener than was formerly thought possible, and that the very best quality of hay may be secured in this way.

F. W. HODSON,
Canadian Live Stock Commissioner.

Is it Profitable to Feed Grain on Pasture?

Is it profitable to feed cows on pasture, a grain ration? If so, how much and which of the following atprices given: Corn meal, wheat bran and old process oil meal, each 1 cent per pound. C. A. J.
Hudson, Mich.

When pastures are at their best, cows need practically no grain, but pastures are not at their best except for a very few weeks. The amount of grain to be fed depends altogether upon the condition of the pastures. Ground corn or middlings if they were not so concentrated, would make an ideal supplement to short pastures. We consider it better to mix bran with the corn or middlings, equal parts by weight, and feed enough to keep up a normal flow of milk. Even when pastures are at their best, a very small feed of grain encourages the cows to report for duty on time.

70 HEAD PUBLIC SALE 70 HEAD

GREATEST OFFERING OF

HOLSTEIN-FRIESIAN CATTLE.

McADAM & VON HEYNE'S

Justly Celebrated Herd of Holstein-Friesian Cattle will be sold at Public Auction, at Brothertown Stock Farms, Deansboro, N. Y., on

WEDNESDAY, JULY 15, 10 O'CLOCK A. M.

SADIE VALE CONCORDIA, THE WORLD'S CHAMPION BUTTER COW, with an official butter test of 30 lbs. 10 2 oz. of butter in seven days, 123 lbs. 10.7 oz. in 30 days, and 220 lbs. 8.4 oz. of butter in 60 days, will go to the highest bidder. Also one of her sons, two daughters five grand-daughters, two great grand-daughters and two great grand-sons are included in this sale, and placed within the reach of every buyer or breeder.

This sale also includes the famous ex-champion, Mercedes Julip's Pietertje, with an official record of 29 lbs. 5.7 oz. of butter in seven days, her daughter and her grand-daughter.

This Sale Offers to Breeders Three Sires of Very Choicest Breeding

SADIE VALE CONCORDIA'S PAUL DE KOL, No. 27,392, three years old; sire Paul De Kol 4th.; dam, Sadie Vale Concordia, official record 30 lbs. 10.2 oz. butter. This is the world's record for mature cows.

SIR PIETERTJE POSCH, No. 30.155, two years old; dam, Alta Posch, official record 27 lbs. 2.4 oz. butter, at 2 years and 11 months. This is the world's record for two and three year old cows.

CANARY MERCEDES JOHANNA DE KOL, No. 30,251; sire Johanna Rue 2nds. Paul De Kol; dam, Canary Mercedes Brightest, official record 21 lbs. 3 oz. at 2 years and 11 months. His four nearest dams average 23 lbs. 5.6 oz. butter in official record; they also average 4.06 per cent. in butter fat. All cows offered are in calf either to one or the other of the above named bulls. The Herd numbers

70 HEAD OF VERY SUPERIOR ANIMALS,

selected with great care. A large number being from the CELEBRATED YEOMANS HERD. This superiority has been strongly demonstrated, having won in last year's official tests more prizes for large and economical production than any other herd either in the United States or Canada.

In this offering of fine stock are cattle suitable for the best herds, also for the improvement of good herds, as well as cattle for the beginner; as the latter, in buying any of these cattle will start with the most famous and most desirable families, the most important, if not the prime factor in the success of breeding pure bred cattle.

The farms can be reached on the D. L. & W. R. R. to Waterville, N. Y., or the O. & W. R. R. to Deansboro, N. Y., where at either station visitors will be met promptly, on the morning of the sale, and conveyed to the farms. Also the farms can be reached by trolley from Utica to Clinton, N. Y., thence by livery. Catalogues ready early in June. Address

Mc ADAM & VON HEYNE, Deansboro, N. Y.

The sale will commence promptly AT 10 A. M. WEDNESDAY, JULY 15, 1903.

COL. CAREY M. JONES, Auctioneer.

SHADY NOOK HERD HOLSTEIN-FRIESIANS. Headed by Mercedes Mechthilde Pietertje. No. 25,795. oldest son of Mercedes Julips Pietertje. 75 O. I. C. White Pigs, both sexes, in pairs and trios, not related.

LOOK HERE.

34 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Gem Pietertje Hengerveld Paul DeKol, or Sir Ormsby DeKol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days, average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd? McGEOCH HERD is located at Lake Mills, Wis., 56 miles west of Milwaukee. For particulars address H. B. Daggett, Mgr., Station A, Milwaukee, Wis Residence: National Ave. near 40th. Phone, South 1601.

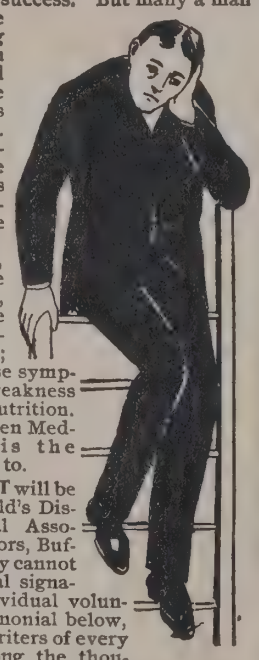
Weed Destruction by Means of Chemicals

Much interest has been shown at a number of the agricultural experiment stations in the possibility of weed destruction by means of chemicals. As long ago as 1895 it was found at the Vermont Station that the orange hawkweed, a serious pest in pastures and meadows, could be destroyed without injury to the grass by sowing salt over the land at the rate of 3,000 pounds per acre. Many experiments have since been conducted at the same station with other chemicals for the eradication of weeds in walks, drives, courts, etc. Among the chemicals tested were salt, copper sulphate, kerosene, liver-of-sulpher, carbolic acid, arsenic and salsoda, arsenite of soda and two commercial weed killers, the active principle of which apparently was arsenic. The weeds which it was sought to destroy were plantain, dandelion, chicory, ragweed, knotweed and various grasses. All the chemicals were applied in solution except the salt. As in the case of the hawkweed experiments, salt was found efficent in destroying all the weeds when applied dry and in large quantity. When salt is used for this purpose adjacent lawns should be protected against washing, or they may be injured. Crude carbolic acid, 1 pint in 4 pints of water, applied at the rate of 8 gallons per square rod, was very efficient. The various arsenical preparations proved valuable as weed destroyers, and choice between them was largely a matter of expense. All things considered, the arsenite of soda and the carbolic acid solutions proved the most valuable chemicals for weed destruction under the conditions of these experiments.

A most interesting series of experiments in weed destruction in fields of growing grain has been carried on at the North Dakota and other stations, as well at as many places abroad. Several years ago, in France, it was accidentally found that a solution of blue vitriol (copper sulphate) destroyed charlock or wild mustard plants. Acting upon this hint, experiments have been conducted in France, Germany, and England, where charlock is one of the worst weeds in grain fields, meadows, and pastures. The method employed is to spray the crop with solutions of blue vitriol while the weeds are young and not too well protected. While the results obtained are in some respects conflicting, the best results have been secured when a 2 per cent solution (1 pound to about 6 gallons of water) is sprayed over the field at the rate of from 40 to 60 gallons per acre. The spraying should be done on a clear, still day, and before the weeds begin to come into flower. If a rain should fall within twenty-four hours, or the weeds are too old, a second spraying will be necessary.

This treatment has been repeatedly tested without permanent injury to wheat, oats, barley and rye, while such weeds as charlock, shepherd's purse, penny cress, etc., were almost completely destroyed. No injury followed such treatment upon young clover growing in the grain. At the North Dakota Experiment Station a 10 per cent solution of blue vitriol was sprayed over an exceptionally weedy plat of wheat, the principal weeds being charlock, wild barley, wild rose, penny cress, shepherd's purse, wild buckwheat, lamb's quarter, and great rag weed. The spraying was made June 1 when the wheat was 3 to 5 inches high, and on August 8 all the weeds except the wild rose and the older plants of penny cress were dead. Some of the leaf tips of the wheat had been slightly burned, but the yield of grain was considerably larger than from an equal unsprayed area. On June 20 part of an oat field containing many weeds was sprayed with a solution of 1 pound of copper sulphate to 4 gallons of water. The oats at the time were about six inches high, the weeds being about the same height. An examination of the plats was made on August 1, and the treated area was free of all weeds except pigeon grass and wild rose. The oat plants were stalky and well stooled, while on the untreated area the plants were weak and failed to stool. The crop on the sprayed portion was believed to be at least one-third more than upon the unsprayed area. The solution was employed at the rate of 40 gallons per acre.

In some regions objections have been raised against the use of solutions of copper sulphate, especially upon plants intended for forage, since it might be possible for animals to get an amount sufficient to kill them. While such a condition of affairs is possible, yet it is hardly probable in the usual practice of weed destruction. To overcome this difficulty the use of solutions of copperas (iron sulphate) is recommended. Where copperas is employed it will be found necessary to have a stronger solution than where blue vitriol is used. Copperas solutions should be from 10 to 15 per cent, or about 1 pound of the chemical to each gallon of water. The results secured with this chemical do not seem to be quite as satisfactory as where the copper sulphate is used, and the increased strength of solution required makes their cost about the same.



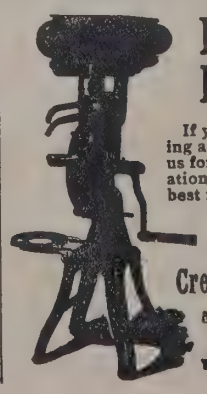
It must not be expected that all weeds may be destroyed by chemicals, at least in an economical way. Some weeds are so protected by hairs, scales, wax, etc., as to render their leaves impervious to the solutions as usually employed. Against such weeds the use of chemicals will be followed by disappointing results, but against charlock, wild mustard, shepherd's purse, wild radish, and penny cress, they may be successfully used if the application be made according to the suggestions given above. The solutions have been found to retard the growth of other weeds, without completely destroying them, as follows: Curled dock, bindweed, dandelion, sow thistle, and groundsel. In any case the results attained will depend upon the thoroughness of the application.—*Farmers Bulletin No. 124.*

About Children Milking.

ED. HOARD'S DAIRYMAN: — It has occured to me that in my article on milking, in DAIRYMAN for June 19, I

AT THE TOP.

It is a laudable ambition to reach the top of the ladder of success. But many a man who reaches the topmost rung finds his position a torment instead of a triumph. He has sacrificed his health to success.



A man can succeed and be strong if he heeds Nature's warnings. When there is indigestion, loss of appetite, ringing in the ears, dizziness, spots before the eyes or palpitation of the heart; any or all of these symptoms point to weakness and loss of nutrition. Dr. Pierce's Golden Medical Discovery is the medicine to turn to.

$3,000 FORFEIT will be paid by the World's Dispensary Medical Association, Proprietors, Buffalo, N. Y., if they cannot show the original signature of the individual volunteering the testimonial below, and also of the writers of every testimonial among the thousands which they are constantly publishing, thus proving their genuineness.

"For about two years I suffered from a very obstinate case of dyspepsia," writes R. E. Secord, Esq., of 13 Eastern Ave., Toronto, Ontario. "I tried a great number of remedies without success. I finally lost faith in them all. I was so far gone that I could not for a long time bear any solid food in my stomach; felt melancholy and depressed. Could not sleep nor follow my occupation. Some four months ago a friend recommended your 'Golden Medical Discovery.' After a week's treatment I had derived so much benefit that I continued the medicine, I have taken three bottles and am convinced it has in my case accomplished a permanent cure. I can conscientiously recommend it to the thousands of dyspeptics throughout the land."

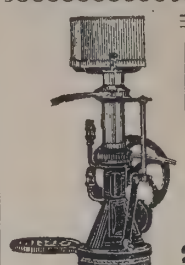
The "Common Sense Medical Adviser," 1008 large pages in paper covers, is sent *free* on receipt of 21 one-cent stamps to pay expense of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

Notice to Dairymen

If you are thinking of buying a Cream Separator write us for Catalogue and information. We manufacture the best machine on the market.

Davis Cream Separator Co.,

54 to 64 N. Clinton St. CHICAGO, ILL.



The New 1903 REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

S. C. SULLIVAN, 425 W. 4th., Erie, Pa.

omitted one important matter, and that is concerning milking by children.

Here in Vermont, where dairies are usually large and help quite scarce, the children are put to milking at a pretty early age. It is well for the boys, and in many parts of this country it will be for the girls as well, to learn to milk as early as they are able to without injury to themselves. But the trouble will be that where the children are at all ambitious and the parents do not consider the matter properly, they will do too much of this kind of work for their own good. At a time when they are growing fast and before they have strength in hands or arms, care should be exercised that they are not allowed or compelled to do too much, and thus result in injury to themselves. This should be avoided as far as possible.

I know of some small boys that regularly milk 10 or 12 cows. This is too much and must be very tiresome for them. It may serve also to beget a dislike for the work, and possibly some might be inclined to slight it, which would be bad for the boys and worse for the cows. Make the work for these young hands as pleasant and agreeable as possible by giving them the best and easiest cows to milk. Also they should learn to treat the cows kindly, which some of the older ones are not always apt to do. The writer commenced to milk with one cow out of the small dairy, getting up early in the morning to attend to this work.

I remember of hearing from my mother, many years ago, of a little girl brought up on a large farm, who was too small to sit on a stool and milk, but would stand up, her head reaching a little above the cow's flank—the old, native cows—and milk like a veritable sprite.

I write this in the interest of children who I am always pleased to see doing well for themselves and others. I would have them learn as early as is suitable for them to do so, the various kinds of work on the farm and in the house, and to do it in a creditable manner; yet I would not have it such as to become irksome or distasteful, but rather pleasant to the young boy or girl, and I am sure, Mr. Editor, that you will fully agree with me in this matter. These boys and girls will soon become the men and women of the future, and we desire to have them prove to be the best in the world.

Franklin Co., Vt. E. R. TOWLE.

Prizes to be Awarded at the 11th Annual Convention National Creamery Butter Makers' Association, Oct. 19-23, 1903.

A championship cup valued at $100 will be awarded to the butter maker whose average score is highest in the six months' educational tests.

For the best package of creamery butter in the convention, a solid gold medal; and for the second best package of creamery butter, a solid silver medal.

To the state delegation having the highest average score, a beautiful silk banner, costing not less than $100, providing there are ten or more entries from that state.

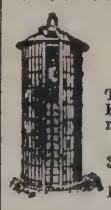
To the butter maker scoring the highest from each state having ten entries or more, a silver cup valued at $50, providing that he is not the winner of the first or second prize, and providing his butter scores 95 or better.

Each exhibitor scoring 93 or over will receive a diploma of merit.

Cash prizes will be given to the amount of $5,000 as follows:

Two thousand dollars to be divided pro rata among all those scoring over 90, no matter whether they are present or not, and $3,000 to be divided pro rata only among those scoring over 90 who are present at the convention. Fifty dollars will be presented to the best appearing state delegation in the procession, and $25 to the second best.

Only one package will be received from a creamery.



The large prizes are offered by the friends of the association to induce butter makers to attend in person. Those sending butter for competition are earnestly requested to come to the convention.

Under the rules no side or special premiums are accepted by the association.

Ensilage Cutters "They Throw and Blow." Pneumatic. "Silo Fillers." Blowers.
These machines cut and elevate with the same wheel at the same time. This wheel has paddles which throw and fans which blow. Without the fans the paddles would throw the ensilage 15 feet high. A light blast of air in addition will blow it to any height. No chains, belts or cogs to slip and waste power. A two-horse tread power will cut and elevate 4 tons per hour, a 10 h. p. engine 20 tons per hour. The easiest running and safest cutters and blowers made. Also cutters and carriers, shredders, silos, engines, horse powers, saw machines, etc. Send for catalogues.
HARDER MFG. CO., COBLESKILL, N.Y.

"NEW HERO"
excels in strength and effective working qualities and sells at a price that "fits the purse." It is the combination of these three features in the highest possible degree which a practical man looks for when buying
ENSILAGE MACHINERY.

The "New Hero" Cutters are the simplest in construction of any made; so strong that, size for size, they weigh more than any others; they have every practical advantage and improvement claimed for others and many found in no other; they are guaranteed to outlast and outwork others. Sizes, 9 in. to 26 in.; with or without self-feed table; shredder attachment if desired; swivel feed carrier. We make also a complete line of sweep and tread horse powers, shellers, huskers, feed grinders, wood saws, windmills, etc. Remember that Appleton quality is the standard of excellence, and write to-day for free catalog.

CLIMAX
Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"
The CLIMAX is **not** a machine with a "blower attachment," nor is it a made over, old style machine with some fans attached. It is a new, complete cutter and blower, made on the best principle.
All the parts of the CLIMAX are built with one end in view—to make a perfect cutting and elevating machine with as few parts as possible, to stand the heavy strain.
The Knives are perfectly straight and have the true shearing cut. They cut clean and even, and are easy to keep sharp.
The Reversing Gear is the simplest made. It is perfectly smooth and absolutely positive. The machine can be stopped or reversed in an instant, without danger of breakage. There are only two cog wheels in the machine.
Cutting and Elevating is done with the same wheel. Less power is required to operate, fewer parts, and great strength are combined.
Made in different sizes. Either mounted or unmounted. The only Feed Cutter made that is on wheels which are part of the machine. No platform required.
The CLIMAX will fill **any** silo in **any** conditions. Fully guaranteed. Ask your dealer, or write for catalogue. Its free.

Cream SEPARATORS all about them and other things for the dairy and creamery A. H. REID Philadelphia

Demand for Butter Makers.

Room at the Top.

ED. HOARD'S DAIRYMAN:—A letter just received from the manager of a co-operative creamery reads as follows:

"The stockholders of this creamery had a meeting yesterday and voted to discharge our present butter maker for uncleanliness, etc. The directors asked me to write you for a graduate of the dairy school, one that has ability for handling patrons nicely, honest, absolutely clean and a good calculator.

I am aware of the fact that this is a pretty difficult time of the year to employ a butter maker, but we have decided that the salary of a butter maker is not so much of a figure when put up against losing butter and patrons daily. What we want is an absolutely spotless creamery, run on a sound basis, and I think our patrons will stay by us.

The greatest difficulty we have to contend with is sour cream patrons. We do not take any sour cream but there are creameries all around us to which patrons haul sour cream and receive extras for their butter. I do not see how they can pay extras for butter made from some of the cream they take, it will not make it. We are proposing to run a cream wagon about ten miles south of here and undoubtedly the cream will be sour when we receive it. Can you suggest any way to overcome this difficulty? If the sour cream was not mixed with sweet cream, could we not make two grades of butter and pay the patrons accordingly?

We test our samples every two weeks. The jars are placed on shelves near the weigh can; our receiving door is toward the east. Now the sun shines on these bottles every morning. Does this make any difference in the test?"

This letter indicates a condition of affairs which I presume is becoming more common among the creameries in this state every day. Sour cream is being delivered to the factories and probably the amount of such cream received daily will increase as summer advances. The letter shows that the patrons of this creamery are becoming convinced, first, that a butter maker of experience and good common sense must be paid good wages. Second, that the creamery must not expect any good butter maker to make butter which will grade as extras from milk or cream which is probably several days old, and decidedly sour when it is received at the factory.

In my reply to this letter I recommended a former student of our dairy school, and I hope that he will prove to possess the qualifications sought for by this creamery manager. Being a dairy school graduate, however, is not always a guaranty that the butter maker will do as he has been taught to do. We have to do the best we can to teach such students as we have and then trust to their earlier training to have developed a disposition in them always to do the best they know how to do. As I have previously stated, we have had a great demand for our students this year and it was hard for me, as this man suggests, to find a good man to fill this place.

In reply to his questions about receiving sour cream at a factory, I stated that the best way to overcome this difficulty is to gather the cream daily. I think this is the best solution possible of the butter quality side of the hand separator question. If the farmers will clean their separators each time they are used and provide clean cans for hauling the cream, and this cream is gathered daily, I think that the quality of our creamery butter will not be lowered by the hand separator. But unless this is done many factories will have just the trouble mentioned by this man.

The cream gathering cans used by the haulers ought to be given considerable attention. An insulated can protected while on the road by a canvass or some other suitable covering will aid greatly in preserving the cream in the condition in which it was obtained at the farm, until it arrives at the creamery. I think in many cases the cream is spoiled by the long journey which it must take in the hot sun to the creamery, even when well taken care of at the farm.

The keeping of sample jars in direct sunlight is not to be recommended. At the present time I think most creameries use some form of corrosive sublimate to preserve composite samples. Such samples are not very much effected by sunlight, not nearly so much as those preserved by bi-chromote of potash. It is not a good plan, however, to allow the sun to shine directly on the samples and this should be prevented by means of a window shade, if there is no other convenient place for the shelves. It is probably not necessary to say that each jar should be tightly covered to prevent evaporation. The sunlight, however, will not have any bad effect on the test when the samples are preserved with corrosive sublimate, provided it does not heat them to so high a temperature that the cream is soured.

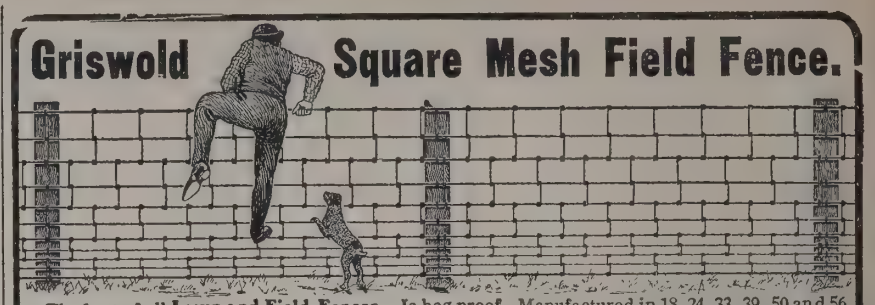
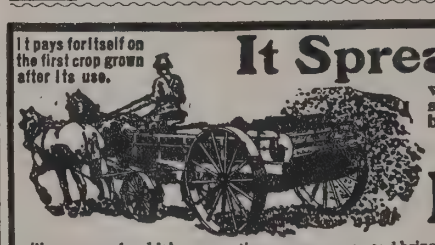
Wisconsin Dairy School.



Devonshire Cream.

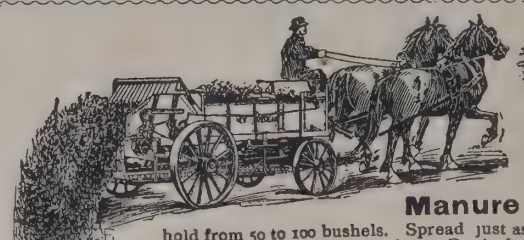
ED. HOARD'S DAIRYMAN:—An English friend while here visiting, remarked that their Devonshire cream was very fine and kept sweet several days without ice. Please inform a new subscriber how our Devonshire friends handle their cream. A. H. R.
Locust Valley, N. Y.



What is known as Devonshire cream is a species of pasteurized cream and is made as follows:

"The milk must be taken direct from the cow, and strained into the pans in the usual way. It should set in a cool dairy, and I believe for want of this cool apartment, many a good housewife has failed to turn out the genuine article. Good, sound pans must be used, as they have to bear constant heating. There is an objectionable plan in some establishments of leaving the milk in the sheds for a time after it is drawn from the cow. Clotted cream made from such milk will not turn out a good flavor, as there is sure to have been more or less tainting of milk while standing about. Just now many Devonians milk out in the open field, and if the cows are quiet the plan has its advantages, for there is no tainting of milk there.

"This requires the most care; indeed, there is nothing else in the whole process but a mere tyro could manage. As soon as the milk is cold, or, say, about nine or twelve hours after brought from the cow, the pans are lifted to the fire. In big dairies, there are what are known as Devonshire stoves especially made for the purpose. The stoves so made, heat water in which a number of pans may be set so as to scald a quantity of milk with little trouble. In smaller dairies the kitch-



The best of all **Lawn and Field Fences.** Is hog proof. Manufactured in 18, 24, 33, 39, 50 and 56 inch heights; in 20 and 40 rod rolls. The narrow widths can be supplemented to any height desired by Barbed or Plain wire, or two strand twisted Cable wire. Manufacturers of **Diamond Mesh Fence. Plain, Galvanized, Barbed or Telephone Wire. Wire Nails and Hay Bale Ties.** Write for illustrated catalogues and price lists. **Dillon-Griswold Wire Co., Sterling, Ill.**

It pays for itself on the first crop grown after its use.

It Spreads Manure,
wet, dry, lumpy, caked, strawy, full of corn stalks, etc., better than it can possibly be done by hand. Spreads lime, ashes, salt, compost, etc.

THE IMPROVED
Kemp Manure Spreader

will save more hard labor, more time, more money and bring about better results than any other machine that can be employed on the farm. It trebles the value of even a small amount of manure. It is the only thing that can successfully top dress wheat in the spring, meadow lands, pastures, etc. Can be hauled onto any land easily and without injury to land, as wheels have broad tires. Can be turned on the ground it stands on, as front wheels turn entirely under. It is strong and durably made of good material and with ordinary care will last indefinitely. Greatly improved for 1903. Send for new illustrated catalogue and "How to Grow Big Crops"—Free. Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.
KEMP & BURPEE MANUFACTURING CO., BOX 46, SYRACUSE, N. Y.

New American Manure Spreaders
hold from 50 to 100 bushels. Spread just as thin or thick, fine or coarse, as ground requires. Don't have to stop team to make change. Most substantial, largest capacity, lightest draft.

Goodwin's

T. D. Goodwin & Co.,
USE GOODWIN'S FLY KILLER
this season and make your stock comfortable. Your cows will give 25 per cent more milk; your beef cattle will fatten with one-half the feed and your horses will do their work with ease. Goodwin's Fly Killer will protect stock from flies when in pasture as well as in stable. It's convenient, cheap, practical. It's a sure lice killer and will keep stables and hog pens in a sanitary condition. Prices: Gallon 75c; 5 gallons $3.00; 10 gallons $5.50. Good sprayer for applying same 50c, or send $1.00 for Sprayer and enough Fly Killer to protect 150 cows. Agents wanted. **T. D. GOODWIN & CO., Columbia Station, Ohio.**

Rippley's Fly Remover

instantly removes all flies, mosquitos, lice and other insects from cattle, horses and other animals sprayed with it. It is healing to any sore. Animals rest easy and feed quietly all day. Cows give ¼ more milk, which is a big saving. 1 gal. will protect 500 cows. Endorsed by the best class of people. Order at once and secure agency, you can sell hundreds of gallons. 1 gal., $1.10; 2 gal., $2.10; 5 gal., $4.50; 10 gal., $9.00. **RIPPLEY'S Special Sprayer** for applying same, 65c; **4 gal. Compressed Air Sprayer** for applying same on large herds, $5.00; 5 gal., 5.50. Money refunded if not as represented. Our Breeders' Supply catalog mailed free; tells how $8.00 per head can be saved by using Fly Remover; ½ bbl. lots of 30 gal., $25; freight paid on 20 or 30 gal. lots.
Gentlemen:—For three years I have been experimenting with different things to keep flies off my cows, but not until I tried your Fly Remover and Compressed Air Sprayer was I successful. I used this last year and found that it costs less than one cent per week per cow. With your Compressed Air Sprayer it takes but a few minutes to put it on, and the result has been that my cows were free from flies, and during the year gave 6400 pounds of milk each, which made 324 pounds of butter per cow. I can heartily recommend it to all stock owners.—JOHN ARMSTRONG, President State Board of Agriculture, De Smet, S. D., June 4, 1901.

1 gal. $1; 5 gal. $4; Sprayers 50c.
ORR & COOPER, Box 829, BEAVER, PA.

STANDARD FLY AND LICE KILLER

en range does duty, the pans of milk being set in vessels of boiling water, or the pans may be set on a heated range. In any case, the object is to scald the milk, and to do it promptly and exactly. It should reach such a temperature that causes a little movement on the surface—a very slight simmer suffices; then it may be removed back to the dairy to get cold. When cold, the cream is taken off at convenience, and that is clotted cream, which is rightly, so highly esteemed. In cold weather the milk is all the better left for twenty-four hours, or even thirty-six, before scalded."

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Bloating.

No. 1. Will you please give me some treatment for clover bloat?

No. 2. Will you tell me how to dry up a cow, so as to fatten her? Is it advisable to dry up milk cows before freshening? H. J. W.

Bloomington, Ill.

ANSWER.

No. 1. It is always best to keep on hand a trocar and cannula, and tap the animal as soon as she bloats. After tapping you may give an ounce or two of hyposulphite of soda, and an ounce of powdered ginger in a quart of warm water to prevent fermentation and cessation of digestion.

No. 2. If you will cease to milk the cow, she will soon dry up. It is advisable to allow a cow to dry up before freshening.

Warts on Teats.

I have a two-year old heifer whose hind teats are covered with what seems to be warts. They vary in size, one as large as a walnut, making it very bad for milking. L. W. H.

Woodfords, Maine.

ANSWER.

Clip them off with a sharp pair of scissors and touch up the wounds with a stick of lunar caustic; after this keep the parts clean, and soften with lard occasionally.

Scabs on Calves.

My calves shed the hair around the eyes, nose, head, then extends back on the body, finally they scour bad and die. They were kept in a pen in the cow stable. The stable and barn built new two years ago; would whitewashing the inside of the stable and calf pen, prevent further trouble in that direction. W. W. H.

La Crosse, Wis.

ANSWER.

Wash the parts with a solution of Zenoleum, taking one quart to five gallons of water, apply once daily. Whitewashing the pens will be beneficial.

Disinfecting Stables.

Please advise the most economical and effectual way of thoroughly disinfecting cow stables? R. L. R.

Spokane Bridge, Wash.

ANSWER.

It is advisable to cover the floor with a thin layer of slacked lime, after each cleansing; whitewash the walls, and spray the stalls at least once daily with a good disinfecting solution. The writer uses for this, Zenoleum as directed by manufacturers, though there are other preparations of equal value for this purpose. See ads. in DAIRYMAN.

Cow Pox.

Some of my cows teats are very sore, a little hard lump forms, and after two or three days her skin turns yellow on same, and seems to be full of a watery substance. G. A. C.

Kempton, Ill.

ANSWER.

Your cows have cow pox. Wash the parts clean and apply iodine ointment after each milking. Such cows should always be milked last to keep the trouble from going through the entire herd.

White Scours.—Trouble With Milk.

I have lost several calves with what appears to be the white scours. They seem to be all right when they come, but in about twenty-four hours they commence to scour and keep getting worse very fast. The passages turn from a natural to a whitish or milky color.

Have been having a good deal of bother about the night's milk straining at the factory in the morning. It appears at first with little flakes which rise with the cream and after being strained remain in the strainer. Or, in using the cream in the coffee, at first there will be little flakes rise in the cup and will not dissolve like natural cream, and as it gets worse it will rise in large chunks and will not mix at all. It seems to be all right when fresh, but gradually gets worse with age. I have been using some disinfectants which seem to help some times but not always

Andheim, Cal. H. H. C.

ANSWER.

Make a complete change in food of cows, give to each in food, once daily, two ounces of sulphate of soda until there is a change in the milk and cream. Give the calves so affected tincture of opium, 2 drams; tannin and salicylic acid, of each 1½ drams. Mix and give in a pint of linseed tea every three hours until relieved. Before giving the above you may give a tablespoonful of castor oil to each calf.

The cause of the white flakes appearing in the milk is uncertain, but as they do not appear until some time after the milk is drawn from the cow, it indicates some species of bacteria as the cause. The remedy is a thorough cleaning of all milk utensils with scalding water and washing soda. Attention should also be paid to the cleanliness of the cows and stables. In such a case disinfectants are of little value as they do not remove the cause of the trouble but only suppress it for a time.

Unknown Disease.

Two of our heifers have just dropped calves that lived only a few hours; calves were perfect, but had a big bunch on the side of their necks. I cut into this and it looked much like a piece of liver full of blood; they seemed to have trouble with their breathing and lay stretched out full length on the ground, not getting up, but occasionally giving a few strong kicks or struggles, and bawling rather unnaturally. H. BROS.

Mission, Wash.

ANSWER.

The trouble requires personal investigation; it would not be safe to make a rough guess at so important a question. Consult a qualified veterinarian and have him make a thorough investigation.

Fistula.

One of my cows has a running sore on the bottom of the udder between the four teats. W. B.

High View P. O. Assa., Canada.

ANSWER.

Your cow has a fistula between the teats which must be removed surgically. Medical agents will not destroy it on account of its being situated in an unfavorable part of the body.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

Creamery Investigation in New York.

ED. HOARD'S DAIRYMAN:—You asked me if I could give you some dairy articles and particularly facts, and that reminds me that a Vermont man wrote me personally if what was published in one of your March issues regards putting the second growth of grass in silo, was a fact I never have tried in any manner to mislead any brother farmer, and must say what is published under my signature is just as I find things in my own experience or the experience of others, and in the following I shall report the same just as I find it, hoping the experience of a few farmers who got together to see what they could do may induce others to profit by their experience.

During the latter part of the winter of 1901 and the fore part of 1902, a few progressive farmers who meet weekly at a small club house erected for the special purpose of such meetings, began to discuss the question of how they were to continue to maintain the fertility of their farms, as the selling of hay seemed to be the only remunerative crop they could produce. It must be remembered that the locality I am writing about was a strictly grain growing section and was called the Lime Stone section, where in years gone by large crops of clover seed, wheat and barley, oats and corn were grown. The failure to mature clover seed was the first great misfortune to this locality. The scarcity of farm hands, both in doors and out, was another great drawback, the low price of meat a few years ago discouraged the growing of beef and pork. Now, what was to be done with farm lands decreasing in value both in price and production?

A creamery was proposed at Oakwood, a small station on the L. V. R. R. about midway between Avasco and Cayuga Lakes. The first objection was raised: What shall we do for water, as there was no available water near for the purpose, as we all know without water a creamery would not be of any account. A liberal citizen who owned large land holdings adjacent, proposed to furnish all the water they wanted, and immediately set a steam drill to work in the lime rock. The result was, an inexhaustible supply of water at 45 degrees was obtained, and while this drill was going down among the rocks the interest of those farmers increased. A committee was formed to visit some creameries in the county and report what they found out.

About this time the creamery sharks got wind of what was going on, and they began to put in their work, but the good sound sense of the hoary sons of toil prevailed, and they gave them the go-by, and went to work on their own good judgment, by forming a company with a certain amount of capital in shares of $50 each. The stock was soon all taken, as the people had confidence in the men who were at the helm. The farmers' wives were almost overjoyed when they were assured of the creamery, for they readily looked forward to the relief from the daily care of the milk, beyond what they received in the house for the wants of the family.

The result to-day is two skimming stations have been added, and a stable enterprise is assured. Almost one of the first acts of the committee was to secure a first-class buttermaker, and one who wanted every thing on a square basis, and is very particular about his statement to the patrons.

I give below his form of statement. Perhaps some one can give him one better, as that is what he would like if it is possible.

A CHANCE TO MAKE MONEY
I have berries, grapes and peaches a year old, fresh as when picked. I used the California Cold Process. Do not heat or seal the fruit, just put it up cold, keeps perfectly fresh, and costs almost nothing; can put up a bushel in 10 minutes. Last year I sold directions to over 120 families in one week; anyone will pay a dollar for directions when they see the beautiful samples of fruit. As there are many people poor like myself, I consider it my duty to give my experience to such and feel confident anyone can make one or two hundred dollars round home in a few days. I will mail sample of fruit and full directions to any of your readers for nineteen (19) 2-cent stamps, which is only the actual cost of the samples, postage, etc. FRANCIS CASEY, St. Louis, Mo.

Special Offer of Fine Dairy Farm
ADJOINING RED WING, MINNESOTA.
174 ACRES—140 under high cultivation, balance good pasture and woodland. Has complete machinery for Dairy, with power, etc., and all machinery for cutting corn. Large horse barn and granary. Improvements could not be duplicated for less than $7,500. Monthly receipts over $600. All for sale at $12,000.
H. A. CAMPBELL, 107 E. 4th St., St. Paul, Minn.

DO YOU WANT A HOME
in Central Wisconsin? We offer very desirable lands to actual settlers. Our lands are in Marathon County and are some of the very best hardwood, agricultural and dairy lands in the state. Deep clay loam soil. Good water easily obtainable at but little depth. Country opened with good roads and well populated.
Schools, both public and parochial, churches, general stores, bank, creamery, etc., within easy reach. Ready market for farm and forest products.
Terms reasonable. If you desire to improve your condition write for further particulars to
RIETBROCK LAND & LUMBER CO., ATHENS, WIS.

FOR SALE MY DAIRY FARM 198 acres, 1½ miles west of University. Would sell farm with or without stock. Write for detail description. G. B. M.,
P. O. Box 144, Charlottesville, Va.

Buy You a Ticket to CROOKSTON, MINN., and call upon
The Polk County Land & Loan Company
For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.
360 acre farm, 4½ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x44. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.
This is a 320 acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.
160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

IOWA FARMS For Sale $45 to $65 Per Acre.
We offer improved Iowa farms close to church, school and town, with local telephone and rural mail delivery, soil rich, black loam, and level, at $45 to $65 per acre. We also have special bargains in North and South Dakota and Canada. If you wish to buy or sell land or city property anywhere, write to us for confidential terms. We make a specialty of long range sales, so no matter how far away you live, if interested write us. We refund railway fare to parties who buy of us Send for price list with pictures of farms.

No Matter What Its Company

may be, butter will be preserved through commission houses and markets as well as in the household, if it is wrapped in our

Pioneer Brand Parchment Paper.

Outside smells and odors never penetrate through it, and it shuts in all the delicious flavor. Preserves butter better and longer than by any other means. If you make good butter you may get the name of so doing by letting us print your name, dairy or brand on every sheet. It never rubs off or discolors butter, and you can have no more effective advertisement. Parchment paper samples will quickly convince you of their value. Send for them. Sent free. Ask also for copy of our free book, entitled "Better Butter."

are all salt, no impurities. Improve the quality and yield of milk. A modern convenience, always present, animals never neglected, and costs for each only about a nickle a month. See how they enjoy helping themselves when you place it within reach. For all stock. Buy of dealers or send for free booklet to

Belmont Stable Supply Co., Brooklyn, N.Y.

A SUCCESSFUL SHORT-HORN SALE.

The Wisconsin Short-horn Breeders' Association held a combination sale in the stock judging room at the dairy barn of the Wisconsin Experiment Station, at Madison, on the 10th inst. Forty-three females were sold at an average of $123.10 and six bulls at an average of $97.50. The highest price realized was $310 for a three-year-old heifer purchased by F. W. Coates, of Dubuque, Ia.

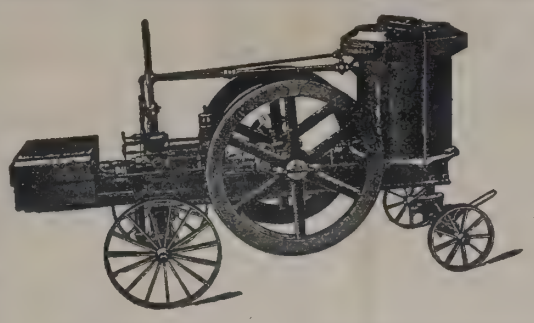
Mr. Geo. McKerrow, Supt. of Farm Institutes and President of the State Agricultural Society, in the course of some introductory remarks, is reported to have spoken in part as follows:

"This sale will be a success because there are sensible people here who want to buy Short-horn cattle. We have promise of an immense crop of hay and grain, as we always have, and we will have plenty of feed to feed them. We should keep all these cattle here to enlarge the Short-horn herds of Wisconsin. We have a great many farmers in Wisconsin who are not dairymen. They want cattle to eat up the rough feed on the farm and turn it into money. For the farmers who are not dairymen, probably no class of cattle suit them better than Short-horns."

We quite agree with Mr. McKerrow that "for the farmers that are not dairymen, probably no class of cattle suit them better than Short-horns," but we think Mr. McKerrow unintentionally fell into the quite too common error of leaving the impression with his hearers that dairy cattle are not as profitable consumers of rough feed on the farm as beef cattle. If there is any difference in this respect, we believe that the dairy cow will consume just as much coarse feed as her beef brother or sister and turn it into more profitable channels as well. It is altogether a mistake to suppose that the dairy cow is not fitted to consume large quantities of roughage.

When one compares the prices realized at this sale with those realized at the McGeoch sale of Holsteins recently held in Milwaukee, he cannot fail to be convinced that rearing dairy cattle of high quality in Wisconsin, is quite as profitable as raising Short-horns.

Georgia Dairymen's Association.



ED. HOARD'S DAIRYMAN:—The annual meeting of the Georgia Dairymen's Association is to be held in the city of Athens on the 4th and 5th of August. We are arranging a good program and believe that we are very fortunate in having the promise of Prof. W. A. Henry to be with us and make two addresses.

All railroads south of the Ohio River will sell round trip tickets for one fare, plus 25 cts. These tickets may be purchased on Saturday, Monday and Tuesday the first, third and fourth days of August. W. L. WILLIAMSON.

RAISED 129 PIGS FROM 13 SOWS

ST. JOSEPH, ILL., April 11, 1903.

"Word comes to us that one of Fithian's prosperous farmers, John Rueb, is the champion hog raiser of central Illinois. In the last two weeks he has had 13 sows that farrowed 129 pigs, all living, healthy and strong. Mr. Rueb claims that his success is greatly due to his using "International Stock Food," which he has used for several years. John is one of the up-to-date farmers and he will continue to use "International Stock Food," and says he can always raise more pigs than any of his neighbors, unless they use "International Stock Food."

From ST. JOSEPH RECORD.

☞We Have Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine and Unsolicited.☜

We own "International Stock Food Farm," which is located 12 miles from Minneapolis and contains 650 acres. We feed "International Stock Food" every day to all our WORLD CHAMPION STALLIONS, DAN PATCH 1:59 1/5 and DIRECTUM 2:05¾; to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. "INTERNATIONAL STOCK FOOD" ☞3 FEEDS FOR ONE CENT☜ is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human system. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these Medicines promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High-Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Fifty Thousand Dealers throughout the World. ☞Your Money will be Promptly Refunded in Any case of failure. It will make your Calves or Pigs grow Amazingly and has the largest sale in the World for keeping them healthy. ☞Beware of the many Cheap and Inferior Imitations. No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or a Falsifier.

Alfalfa Hogs.

We have recently spent a week in the Platte valley of Missouri making a somewhat critical study of two points in the agriculture of that region–alfalfa and sugar beets. We were fortunate in meeting with a number of farmers from Illinois and Iowa who keep books and scales and grow hogs on alfalfa, and can, therefore, give us some quite accurate data as to the cost of growing hogs in that way. The brood sows are kept through the winter on a ration of five pounds of chaffed alfalfa hay and one pound of corn. The summer feed of sows and pigs is from one to one and one-half pounds of corn per day and as much alfalfa as they care to eat.

Hogs grown in this way do not make as rapid gains as are made with a heavier corn ration, the gain being about one-sixth of a pound per day for the first two hundred or two hundred and fifty days, and the cost being not far from two cents per pound with corn at 40 cents per bushel. The gain reported is incredibly small.—Ed.

What particularly impressed us, however, with hogs grown in this way was the tendency to differentiate in type from hogs grown under the conditions prevailing in Iowa and Illinois, and the clover country of Kansas and Nebraska. These hogs are longer in the body, set up a little higher on their legs, partaking somewhat of the bacon type, and unquestionably have much greater vitality and disease resisting power. It will not be a great while until the term "alfalfa hog" means a different type of hog from that grown east. In fact, we believe that in time to come, when the railroads master the problem of carrying hogs through without disease, that quite a per cent of the hogs of the country will be grown west of the corn belt where alfalfa does better than it does in the corn belt, and shipped east to cattle feeders and farmers who have more corn than hogs. These hogs when put upon a heavy corn diet, whether on an alfalfa farm or off it, make very rapid gains, and we believe will make better use of corn than hogs grown on a corn ration. In fact, we are very sure of this. Theoretically it can be no other way.

We found indications, too, that hogs grown on alfalfa have much greater resisting power to cholera than hogs grown on corn and subjected to the same disease under the same conditions. Theoretically this should be true, and we believe experience will prove it.

Two points are suggested: First, that it will pay every farmer who has land near his farm that will grow alfalfa to make an effort to secure an alfalfa hog pasture next year; either alfalfa alone, or alfalfa mixed with say alsike clover, or a mixture of common red and mammoth. Where it is used as a hog pasture exclusively, this will be entirely practical. We do not think it will be desirable to do it in an alfalfa country. In fact, in that section it is found best to put not more than six hogs per acre on the alfalfa field, and then mow it regularly when it should be mown, that is, when it begins to bloom. Hogs really only make paths through that much of it and that number does not interfere with cutting a fine hay crop and thus have alfalfa fresh for the hogs every six weeks or two months.

The next point that suggests itself is, why may not the farmers do the same thing with clover? They could not get the same results, but they can get results approximate to it to some extent; that is, if they will take a year and grow their hogs and feed a pound to one pound and a half of corn, thus making the full use of clover and rape, they can grow hogs approximately as cheap as farmers can in the alfalfa country. This, of course, applies only where farmers want to grow hogs to heavy weights and take from a year to fifteen months time. It would not apply where farmers want to push hogs as rapidly as possible. In that case the full use of the clover cannot be made but they will receive enough to balance the corn ration and make a considerably better use of the corn than can be made where it is fed *ad libitum*.

There is a good deal more that could be said on this subject. We are simply giving impressions after a week's study of hog growing in the alfalfa section.—*Wallace's Farmer*.

DON'T BREAK YOUR BACK washing clothes 52 times a year. Get a "1900" washer and save labor, time and money. You need not send a cent or pay freight. It is sent absolutely free, freight prepaid on 30 days trial. A word to the wise is sufficient. Write at once to "1900" Washer Co., 219A State St., Binghamton, N. Y.

If you want pictures, perfume, paper lace and cardboard, you can get them with toilet soap; but they only add to the selling price and do not improve the soap. Sometimes an elaborate wrapper is used to sell a poor soap. Ivory Soap is put up in a plain, unpretentious wrapper, but is the purest soap manufactured.

IT FLOATS.

Soft Pork.

The South Carolina and Alabama experiment stations have observed that the fat from pigs fed peanuts was oily and had a low melting point.

According to the Alabama station this was corrected to a certain extent by feeding corn before slaughtering.

Fifty years ago in the east there were two general feeds for hogs for the pork market. One was corn and the other was distillery feed. The distillery fed hogs all produced the soft pork and a runny lard. That is, it did not have the usual firmness of corn fed pork. And it was considered the strongest recommendation if you were able to say that your pork was corn fed, as it was not believed that anything else in the feed line would make pork equal to that which was fed corn.

We know that quite a number of farmers practiced going to the distillery and buying distillery-fed hogs and feeding them four weeks on corn, and it was believed that this changed the texture and firmess of the pork, overcoming the softness caused by the distillery slop.

The beechnut, that some years is in sufficient quantities to fatten hogs, makes an oily bacon, soft, but exceptionally sweet and of fine flavor.

The Canadian experiment stations have been studying the cause which produces soft pork for some years, and they go back upon the established general belief of firmness produced by corn feeding, and state that the highest quality of firmness is produced by a combination ration—the grain ration consisting of a mixture of oats, peas and barley—and that Indian corn and beans tend to produce softness, though a large percentage of corn can be fed with a proper mixture in conjunction with skim milk, without any injury to the quality of the pork.

This is so opposed to the ideas of the general farmer, which he has found from experience in producing the home cured meats, that it will be difficult for them to believe these statements. — *American Swineherd.*

Alfalfa and the Swine Industry.

The Hay No Longer Restricted to Corn Belt —The Drouth Robbed of its Terrors.

There promises to be a revolution in the swine growing and feeding industry of the country. Heretofore there has been but one phase to the hog business, and that is, the corn belt of the country has been the hog belt, solely and exclusively, for all other sections did not grow or fatten enough porkers to supply the demands of the consuming centres Upon the corn crop of the Mississippi Valley states, therefore, depended the swine output. Gradually, as the corn country pushed its way to the west, the pork belt also followed, spreading from Illinois, Ohio and Indiana to Missouri, Iowa, Nebraska, Kansas and the Territories. When all available corn lands of these last named states and territories had been taken up, however, it seemed that the hog belt had reached its limit, for the "arid" and "semi-arid" districts of extreme Western Kansas, Colorado and the Southwest were barriers that forbid the incursions of the hog growing industry.

The barriers that seemed insurmountable, however, have proven to be all bugbears, for alfalfa has taken up the march where corn left off, and the hog is now following the hay where formerly it followed the grain. Shippers from the west tell of the immense impetus given the swine breeding business in their country since the value of alfalfa as a hog feed has been ascertained. Three years ago it used to be a standing joke—this feeding of hay to hogs—and many a green city chap has had occassion to rue his questionings along that line. Now, however, green cured alfalfa is the principal winter feed of swine in the west, and the growing plant is the chief fattener in the summer months Hogs are coming to market right off alfalfa that have never tasted grain in their lives, and they sell and kill out right along with hard corn finished swine. It has been found that sows do better with their pigs if they be kept on an alfalfa diet and not allowed to overfeed with the more heating corn. Many western farmers handle their pigs from infancy until within a month or so of marketing on alfalfa alone, and then finish the swine on grain. Others claim the latter is unnecessary, even if the pigs be allowed green pasture. The western farmer who has a fair to good crop of alfalfa need never worry about keeping his hogs through the winter in the absence of corn. Bad months may come and hold on all summer, but so long as they leave enough alfalfa for winter roughness the farmer need rush no stock to market in order to avoid its starving to death in the winter.

Alfalfa has thus robbed a drouth of its terrors and provided a new and bounteous feed for swine. The inevitable result of this is that it will cause a shifting about of the centre of hog production of the country. Heretofore the corn belt has been officially and unofficially recognized as "everything" when it came to hogs, but it would seem the day for the passing of this monopoly has arrived. Corn has long been regarded as the natural feed for swine, and there is no reason to believe that it will be entirely displaced by another plant, but nevertheless it is certain that alfalfa is looming up as an essential factor in hog production. The new plant will take its stand alongside of corn and will compete with the latter in the markets of the country. The east will no longer be able to point to itself as the Alpha and Omega of the hog business, and fear for what the country will do should it fail to keep up its output for a single year. Even should the swine belt not shift from the east to the west, it is absolutely certain that the former will have to share with the latter the honor of filling the demands of the markets of the country. It is now corn, alfalfa and pork, and not corn and pork.— *The Drover's Telegram.*

Weeds in Alfalfa.

ED. HOARD'S DAIRYMAN: — Have 2 acres alfalfa, sowed June 1st, have a fine stand but also have a better stand of weeds. What would you advise doing?
Roodhouse, Ill. A. H. B.

The young alfalfa should be clipped during the first season, whenever the weeds seem to be getting the upper hand and especially before they go to seed.

Rape and Teosinte for Hay.

Please tell me through the columns of the DAIRYMAN how late I can sow Dwarf Essex rape and Teosinte and be reasonably sure of a crop. Also tell me what is the value of each cured as hay for winter feed My corn is late and I want to sow rape in one field and Teosinte in the other, but do not need them for forage or after feed.
Palatine Bridge, N. Y. L. B D.

It is never advisable to attempt to make hay of rape.and concerning Teosinte Prof. Henry in his work on Feeds and Feeding says, "This plant is too tropical to have a forage value outside a belt bordering the Gulf." Dwarf Essex rape may be sown at any time from early spring until August in the Northern States, the seed being scattered at the rate of three or four pounds to the acre broadcast, or two or three pounds in drills 30 inches apart. The crop is harvested by turning the stock directly into the field to consume the abundant leaves and stems.

THE GERMAN AGRICULTURISTS AT THE WISCONSIN EXPERIMENT STATION

German Farmers Entertained at Dreamwold by Thomas W. Lawson.

Costly Souvenirs Issued.

ED. HOARD'S DAIRYMAN:—Dreamwold Farm of Thomas W. Lawson, opened its gates, draped with the German and American flags to 36 members of the German Agricultural society this morning at 10 o'clock. The Germans were entertained in a royal way until sundown. One of the most pleasing features of the occasion, and one which the visiting guests considered the greatest courtesy that has been shown them since they came to this country, was a presentation of a handsome souvenir of Dreamwold to each guest by Mr. Lawson. In this, he outlined his program for the entertained and expressed his greetings.

The souvenirs were not thought of until Friday eve, but were compiled, printed, bound and ready for distributing when the guests arrived at the gates of Dreamwold.

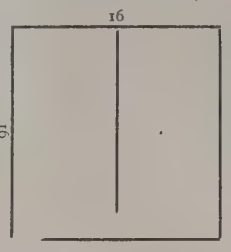
Friday eve, Mr. Lawson received a notice of the intended visit of the delegation and straightway he dictated the text that he was to give to the printer Saturday. The souvenirs were finished this morning, 10 o'clock. It required the making and mounting of 2800 8x10 photographs, and setting up the printing 37, 10x12 forms and the assembling and binding of the printed sheets.

Speaking of the book, one of the members of the delegation, said: "It is a souvenir that will be cherished with fond remembrance of the kindness and hospitality of the master of Dreamwold." The German delegation left its special cars at Egypt Station at 10 o'clock, and was cordially received at the gates of the farm by C. C. Clapp, who in the absence of Mr. Lawson, acted as host, Mr. Lawson, who was detained in Boston by business.

GERMAN FLAGS DISPLAYED.

Across to Dreamwold, American flags were entwined with the colors of Germany. This pleased the delegation and before entering, its members stopped to admire decorations. Passing inside the gates the visitors were taken in charge by Mr. Clapp. In barges they were taken over the driveway of the farm. The trip was followed by an inspection tour on foot. The stables, where some of the finest horseflesh in the world is kept, were first inspected.

The brood-mare stables and service building, and the carriage building containing over forty different kinds of carriages, were also visited. Then they visited the dog kennels, the farm horse stable and the beautiful cow barn, the home of Flying Fox, the champion Jersey Bull, and his daughters. The herd numbered 47 head and the herdsman, P. H. Robinson, drew milk from the rudimentary teats, which surprised the German delegation. They said they had travelled over all parts of the country and the only bull they had ever seen to give milk in Germany or this country and all took snap shots at Flying Fox.



Early in the afternoon the Germans were entertained at lunch in a tent, and while they were eating, the chimes on the tower but a short distance away played, The Watch on the Rhine. The early part of the afternoon was devoted to a display of horses and horsemanship in the riding academy.

When the exhibition had nearly come to a close, the host's daughters, Gladys and Dorothy Lawson, rode in upon the Tally-ho and waved their hands to the visitors. The guests arose from their chairs and lifted their hats as the coach passed. The Misses Lawson acknowledged the courtesy by again waveing their hands and smiling. At the lunch, every visitor had been presented with a Lawson pink, which he had up to that time worn in the buttonhole. As the coach again made the circuit of the track, the Germans arose with their pinks in their hands. When the coach passed close to them, they threw the cherished flowers at the coach. Gladys Lawson caught several of the pinks as they passed. The Germans cheered and shouted, Bravo. After the horse show the visitors were entertained with horse racing on the track. The races were a source of pleasure to the Germans who sported about like schoolboys and made small wagers on the outcome of the races. The visitors left Dreamwold at 5:30 and were to leave Boston at 12:03 for N. Y., where they will stay for a few days before returning to Germany. Among those who made the trip to Dreamwold yesterday with the delegation, were Wm. T. Renick, German consul at Boston and J. I. Schulte of the American Bureau of Agriculture at Washington. P. H. ROBINSON.

Egypt, Mass.

Handling a Vicious Bull.

ED. HOARD'S DAIRYMAN:—I saw an item in last DAIRYMAN from T. F. V., Marshfield, Wis, inquiry for handling a cross or vicious bull. I have had a good deal of experience with them. I find the only safe way is a pen 16 feet square made of 16-foot bridge plank, 3 inches thick, 5 feet high, well spiked up; a door 3 feet wide of the same material, hung with good strap hinges and locked; also a partition across the middle. See diagram. With door hung you can turn bull from one to the other and clean out. We put feed in one end, turn bull in and drive him back. Let him have both pens when you please. I kept one three years in that way. He would kill a man in a minute if he could get to him.

Columbus, Wis. S. W. E.

Notes from New York.

Lessons from the Drouth. A Short Crop of Milk.

ED. HOARD'S DAIRYMAN:—The longest and earliest period of drouth ever experienced in Jefferson Co., has just passed. The meadows and pastures had become, in many instances, nearly a barren waste. The drouth was felt all the more keenly because it came when there was practically nothing to supplement the pastures except grain, and the prospect of a fodder famine made the farmers feel very discouraged. As usual in such cases the new meadows stand the drouth best, due to the fact that the humus has not become so decayed and changed to soil, so that it was capable of retaining the moisture better than the older meadows.

We shall, in the future, make it a practice of never again allowing our meadows to lie down longer than the fourth year, no matter how promising they may be. We are, in the future, going to take good care of the crops of humus to increase the moisture holding capacity of our soils. Most of our soils are strong in the fertilizing elements, but they lack humus, the one great soil sponge that holds the moisture and thereby unlocks fertility.

Never before were there so many milch cows in our immediate vicinity as at the present, and it looked at one time as though they would have to be sacrificed, but the prospects now are that there will be plenty for home use, but little for export.

Another lesson: The corn crop is a very uneven quantity. Some of it came up but hardly enough to leave for a crop. There was not enough moisture in the soil to insure germination. Now why was it? Were our methods wrong? We will never again leave the corn plots untouched until all the other sowing is completed.

We shall go over our corn ground so as to break the direct connection between the moisture in the soil and the air, and stop evaporation, so that when we get ready to sow our corn, there will be something there to make it grow. We have always practiced this method until this year, but for some reason we were not on the lookout for this early dry spell, and took too many chances. Well, we made a mistake and we are ready to acknowledge it. We shall write these two things in big letters on memory's bill board:—Never let the meadows cut more than four crops, and work over the corn ground early, to conserve the moisture.

We hear our dairymen neighbors making a general complaint that their cows are not giving an average flow of milk. I always ask them the question of why? There are always a number of possible reasons available yet they are always traceable to the dairyman himself rather than to the cows. Insufficient feed, unpalatable feed poor water, and makeshifts resorted to at the time of short pastures and water.

Constant vigilance at such times is the price of milk. A farmer must know when the feed and water is liable to get short and ought to give his attention to so important matters as these before the loss is felt by the cattle themselves. Once the cows are neglected and allowed to go without sufficient feed or water, and the fact is immediately seen in the milk pail. One cannot afford to allow his cows during any season of the year to have at their disposal anything less than a full balanced ration. If it isn't supplied to them in the pasture we ought to make up the deficiency in the stable, so that there would be no more shrinkage than naturally comes with the extension of the period of lactation.

We wonder sometimes if the readers of the DAIRYMAN really and truly understand the great underlying principles of balanced rations. We would like to hear from Dr. Kitchen on the subject. We once put this question in an institute question box: "Why is a balanced ration cheaper than one that isn't balanced" and a Cornell graduate gave us a long talk on, The Evolution of the Dairy Cow and said he "guessed that covered the question." Look up thoroughly this question of balanced rations for the cows, horses, pigs and hens and many surprises will be, yours. I don't mean just read it up but if you are sceptical try a couple of your cows with such a ration and note results.

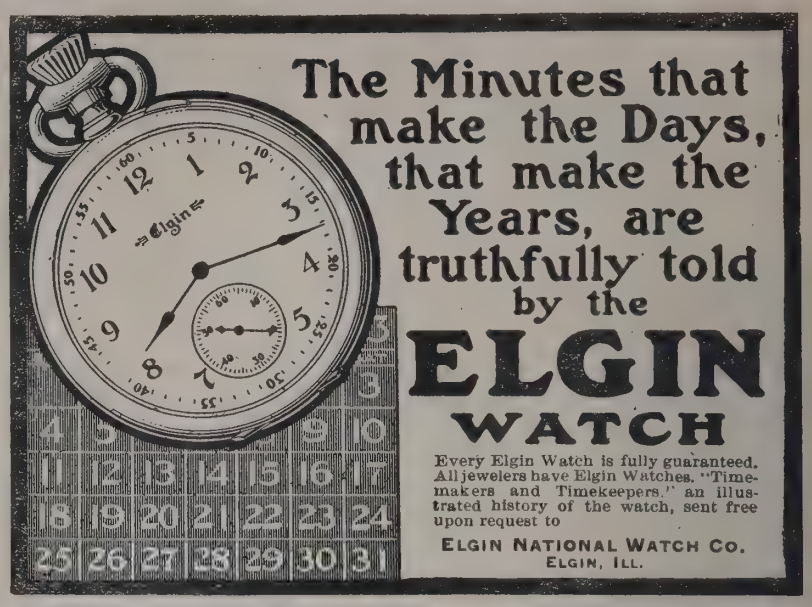
New York. JAS. M. PLATO.

To Kill Weevils in Ground Feed.

ED. HOARD'S DAIRYMAN:—I see in your issue of June 19th, a subscriber asks for a remedy to kill weevils in ground feed and grain. Put the ground feed in an air tight box; and for 1,000 pounds take one-half tea cup of bi-sulphide of carbon; put it in an earthen vessel and set in the box on top of feed, close the lid and cover up with an old blanket; do not open the box for 24 hours, then open and leave open for 24 hours. Do not go around this box with any kind of fire or light for two or three days, as bi-sulphide of carbon is very explosive. It will not injure the feed. It will kill weevils in beans, peas, or wheat and does not injure them for food after being treated.

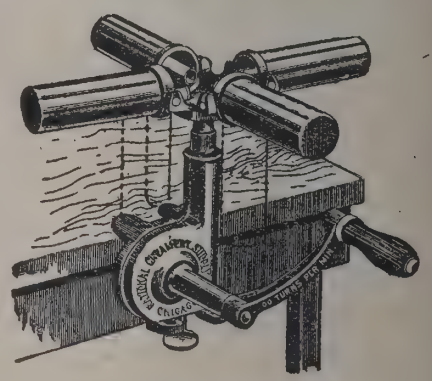
Groton, N. Y. W. P.

DON'T PUT OFF



Seeing your friends and having them join in for a good club of subscribers.

An Alfalfa Query.



I sowed 15 lbs. of alfalfa seed on one-half acre of ground. I top dressed with fine manure and put on at the rate of 200 lbs. fertilizer per acre. As a nurse crop I put 1 bushel oats per acre. I have a good stand of alfala from 2 to 8 inches high and a very rank growth of oats about 1 ft. high. What had I better do with the oats? Leave them till in the milk and cut, or cut it sooner. I could not get it dry enough for hay now, unless it would get better weather than we have had for some time. J. W. D.

Seagertown, Pa.

We had exactly this difficulty on a few acres of alfalfa last year. The growth of oats was so large and the weather so unfavorable, that we found it impossible to cure the oats and get them off the field in time to allow the alfalfa to grow. On so small a piece of ground as this inquirer has, we advise letting the oats get fairly well headed out, than mow the field, and if the weather is not such that the oats and alfalfa can be cured properly for hay, cure them as well as you can, but be sure to haul them off the ground. Better lose this crop of hay than the seeding of alfalfa.

NATIONAL
Babcock Milk Tester

Dotted Lines show position of bottle holders when not in motion.

Has enclosed cut gears.
Swinging bottle-holders.
Runs without jar.
As well made as a cream separator.
Best tester for dairymen ever made.

The weight of machine when boxed, approximately 11 lbs.

DOES YOUR DAIRY PAY?

It costs no more to feed a profitable than an unprofitable cow.

NET PRICES:

No. 1,—2 bottle, complete for testing milk.... each	$4 00
No. 2,—4 bottle, complete for testing milk.... each	5 00
No. 3,—2 bottle, complete for testing cream and milk, each	4 50
No. 4,—4 bottle, complete for testing cream and milk, each	5 50

Prices include full directions for making test, bottle of acid, test bottle brush, acid measure, dipette and test bottles.

We are the great Dairy Supply House of the West. We carry an immense stock of all kinds of Butter and Cheese Making Apparatus and Supplies. Write for catalogues and circulars.

Inflammation of the Udder Among Cows.

ED. HOARD'S DAIRYMAN:—It may be of interest to inquirie into the question of contagion in connection with inflammation of the udder, or as it is commonly called, garget or mammitis.

One of the results of this disease is in certain cases the occurrence of suppuration and the formation of an abscess, and the contamination of the milk with pus. That inflammation and suppuration may be induced by the introduction of pus into healthy structures has been demonstrated over and over again, and in the case of suppurative inflammation of the udder, the experiment of injecting pus from the diseased part mixed with water, into the milk ducts of a healthy cow, has been successful in producing the disease, but so also has the injection of putrid meat juice. If these modes of transmission can be accepted as samples of infection or contagion, there can be no doubt that catarrhal, septic and suppurative forms of mammitis are all contagious or infectious.

Inoculation with any morbid products of udder disease is constantly effected by the hands of milkers, and in this way a single case of garget, ending in the formation of an abscess and the contamination of milk with pus, may lead to the infection of a number of cows, which may be milked by the man who has milked the diseased cow.

Doubtless, the adoption of the most elementary sanitary precautions would suffice to prevent the spreading of mammitis, but the milkers are not pathologists and do not realize that, because one cow is giving milk mixed with pus and blood, the animals in the same shed are likely to be infected with the same disease of the udder, from the introduction of the pus into the milk ducts by the hands of the milkers.

When the discovery is made of the spreading of garget among the cows in a shed, it is more than probable that the animals which were first affected will altogether escape suspicion. But even if, owing to a visit from a veterinary surgeon, the information is given to the dairyman that the disorder is being carried from cow to cow by the persons engaged in milking, it may be too late to repair the error which has been committed; in fact it is most probable that a considerable proportion of the cows have already become more or less infected. Nevertheless, it will be desirable to give instructions that the diseased cows are not to be milked until after the milking of the healthy cows is finished.

It might be supposed that in any case of udder disease, no matter how apparently slight it may be, the cow would be taken out of the shed, or, at least, would be left to the last to be milked. That this very obvious precaution is, however, frequently disregarded is perfectly well known.

A virulent form of contagious mammitis is sometimes met with, but it is not very general. A specific organism has been discovered in this form of the disease, and has been proved highly infective, even when cultivated and injected into the udder in a pure state viz, free from other organisms.

The mode of communication of the more virulent form of mammitis is doubtless by the hands of the milkers, as in the case of the suppurative and catarrhal forms of the disease, and in order to prevent the spreading of the malady, the affected cows should be isolated as completely as may be possible. In this connection, it may be observed that cow sheds in towns are seldom provided with space sufficient for this purpose, and the owner has to make the best of the means at his disposal.

Symptoms of the different forms of mammitis are at the outset too closely related to enable the amateur to make a correct diagnosis at once, but, as the disorder advances, the characters of each form of the malady become more marked.

In the common form, the first signs are tenderness, which is often detected by the milker, when there is very slight evidence of the disease on the surface. The milk may be tinged with blood, and some pink deposit may be found at the bottom of the vessel in which the milk has been received. Small clots may also be noticed slightly stained with blood.

Under proper precautions the disease, in the benign form, may cease with the initial stage, but, unless the milk be effectually drawn from the diseased quarters, and the temptation to avoid the trouble of doing this is fostered by the resistance which is offered by the cow, the affection may rapidly advance to the catarrhal stage. Indurated areas of greater or less extent may also appear, while the pain and swelling of the udder become more evident.

The presence of pus in the milk, with partial blocking of the milk ducts, general fever, with loss of appetite, and excessive thirst, will indicate the suppurating form of mammitis, which may go on to the gangrenous stage if not checked by proper treatment. It is under these circumstances that an extension of the affection is to be feared, and every possible precaution should be adopted to prevent the conveyance of infected matter from the diseased cows to the healthy ones.

Constitutional symptoms sometimes assume an urgent character in the most malignant form of mammitis, and among sheep the disease is often fatal.

Among the consequences of the acute and malignant forms of mammitis, blocking of the milk ducts in one or more of the teats is not uncommon. The obstruction may be of a temporary nature, but as soon as it is detected, which may be some time after its occurrence, steps should be taken to ascertain, by the use of a flexible probe or bougie, whether or not it is capable of being removed. A small portion of clot, from curdling of the milk, may easily be disposed of, but the constriction of the canal, owing to the contraction of the walls, or adhesions, which have been formed during the inflammatory process, require skilled surgical interference for their cure, and where the use of the bougie, or the trochar and cannula, has not proved effective, the amputation of a portion of the teat should be made.

Obviously some means of clearing the canal must be found, or the retained milk will ferment and lead to serious structural disturbances, involving at the least, loss of the diseased quarter. A chronic form of mammitis attended with induration and other structural changes, which progress very slowly, is another termination of the inflammatory action, either acute or sub-acute in its character.

Montreal, Can. W. R. GILBERT.

Cost of Shredding Fodder.

A correspondent of *Breeder's Gazette* wished to know about shredding fodder—the cost and how much fodder an acre will produce. James A. Parden of Iowa, gave him this answer: Most shredders charge by the hour, but a few charge by the bushel. Those that shred by the bushel generally charge 5 cents per bushel; those by the hour charge about $1.50 to $2.50 per hour. It is cheaper for the farmer to shred by the bushel. It generally takes about twelve horses to run a power on a shredder, the farmer furnishing six of them. A good many now use steam engines instead of powers. They generally run by the hour to make it pay. The farmer must furnish the band cutter in both cases. It takes three teams to haul into the machine if the fodder is close by; if not, it takes more. To about every forty bushels of corn you get a ton of fodder, and as it is worth as much as hay it pays better to shred than to seed down valuable land.

DON'T WASTE CORN FODDER.

In view of the fact that the annual crop of corn will yield some 60,000,000 to 80,000,000 tons of corn stover, all of which may be utilized, the American farmer can, if he is thrifty, save one-third of the feeding value of his crop. From this the farmer will learn the lesson that he cannot afford to waste one hill of his corn fodder. It should all be cut and shredded and fed the next summer to save his pastures for the dry fall weather which so often impairs them. With a barn or shed full of shredded fodder the stock can be kept growing all the time and will be in good condition for the feed lot or to enter the next winter.

How to Build and Pay for a Co-operative Creamery.

I wish to say a few words concerning the matter of organizing creameries. If the farmers are inclined to buttermaking rather than cheesemaking, then I say any community that supports a cow population of 400 should co-operate to build a creamery. But how shall we co-operate to build a creamery? In the first place, do not allow any of the numerous creamery "promoters" to teach you co-operation in creamery matters; they charge too high a price for the instruction and their teachings may not be correct. Very few first-class creameries are put up by these promoters, and we cannot afford second-class creameries. You have right in your midst some bright, hustling young man whom you can send to one of the up-to-date creameries of Michigan, and get just the information you are after with reference to the building of a creamery.

Now, how shall we get the funds to build a creamery? A good method is, briefly, as follows: Let 40 or 45 farmers each subscribe $100 in the form of a note bearing, we will say, 6 per cent interest; 45 such notes will furnish the funds necessary to build a first-class creamery. Hand these notes to some responsible person who can put up the cash for them, perhaps a banker. As already suggested, let some one of your number be paid a salary to get the necessary information on the construction and equipment of a creamery and allow him to proceed to build it. The cost of the creamery and the salary paid will not exceed $4,500. You will see, therefore, that you can get a creamery in your neighborhood by simply paying the interest on $100 until the creamery is paid for. A creamery, if rightly managed, will pay for itself in a few years, and will always stand as a blessing in your community.—JOHN MICHELS in *Ohio Farmer*.

"ADVERTISEMENT."

BABY WEATHER.

Little Fellows Don't Like the Hot Days.

Mothers should know exactly what food to give babies in hot weather.

With the boiling hot days in July and August the mother of a baby is always anxious of the health of her little one and is then particularly careful in feeding. Milk sours quickly and other food is uncertain. Even in spite of caution, sickness sometimes creeps in and then the right food is more necessary than ever.

"Our baby boy two years old began in August to have attacks of terrible stomach and bowel trouble. The physician said his digestion was very bad and that if it had been earlier in the summer and hotter weather we would surely have lost him.

Finally we gave baby Grape-Nuts food feeding it several times the first day and the next morning he seemed better and brighter than he had been for many days. There was a great change in the condition of his bowels and in three days they were entirely normal. He is now well and getting very strong and fleshy and we know that Grape-Nuts saved his life for he was a very, very ill baby. Grape-Nuts food must have wonderful properties to effect such cures as this.

"We grown-ups in our family all use Grape-Nuts and also Postum in place of coffee with the result that we never any of us have any coffee ills but are well and strong." Name given by Postum Co., Battle Creek, Mich.

The reason Grape-Nuts food relieves bowel trouble in babies or adults is because the starch of the grain is predigested and does not tax the bowels, nor ferment like white bread, potatoes and other forms of starchy food.

The Empire Way

Makes Cows Pay.

How's This for a Record?

Emporia, Kans., Jan. 2nd, 1903.

Empire Cream Separator Co., Bloomfield, N. J.

Dear Sirs: Have used one of your **Empire** Cream Separators for the past eight years, during which time I have been milking at all times from twelve to fifteen cows. The cost for repairs in the eight years has been only seventy-five cents. I have had experience with other separators but consider the **Empire** superior to any other, as it never caused me any bother. It is easy to clean and has proven very durable. It does good work at all times. L. H. VAHSHOLTZ, Rural Route No. 4.

The Empire Cream Separator turns more easily, is more easily cleaned, does better work, and costs less for repairs than any other, because it is the **simplest separator made.** Don't buy a separator until you have investigated the merits of the Empire.

Send for our new book on Making Milch Cows Pay.

Empire Cream Separator Co., Bloomfield, N. J.

Eight Years 75 cents for Repairs Fifteen Cows

Scott's "Perfect" Cow Stanchion

SWINGING
SELF-CLOSING
SELF-LOCKING
3
NECESSITIES FOR PERFECT STANCHIONS

Made of hard wood—strong and durable. Price $1.00. Satisfaction guaranteed.

Write for descriptive circular.

B. C. SCOTT, 212 Beach St., Bridgeport, Conn.

THE NEW PATENT

Cow Stall

AND FEED TROUGH.

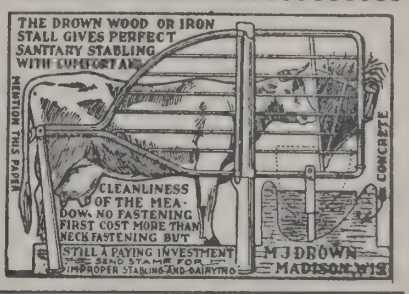
This is the only Cow Stall with a centering hinge. Stalls all fold back to manger as the cows go out the barn. When ready for use, by starting one stall all come into position. No post at the gutter. Send for circulars. **R. A McLERY & CO., Palmyra, Wis.**

Prescott's Swinging Swivel tanchion

Keeps Cows Clean.

Swings forward while getting up or lying down. Looks back while standing. Full particulars free.

E. PRESCOTT,
Beverly St., Boston, Mass



The BEST Cattle Fastening.

SMITH'S Self-Adjusting Swing Stanchion. The only PRACTICAL swing stanchion invented. Thousands in use. Illustrated Circular free. GLENORA MFG. CO., Glenora, Yates Co., N. Y.

Infringements will be prosecuted.

A Steel Stanchion beats anything you ever saw fo. tying cattle. Lighter, stronger, neater. Swings on chains Not in the way when lying down. Agents wanted. Write for special terms and prices. **Jas. Boyle, Mfr., Salem, O.**

CHAIN-HANGING

CATTLE STANCHION

The Most Practical **CATTLE FASTENER** ever invented. Manufactured and For sale by

O. H. ROBERTSON, Forestville, Conn.

WILDER'S STANCHION

Being an improvement over Smith's. Lightest, strongest, quickest, safest stanchion made. Has steel latch and automatic lock. Becomes stationary when open. Animal cannot turn in it in backing out. Made of best seasoned hard wood. Pins for fastening with every stanchion. Send for testimonials.

J. K. WILDER & SON, Box 11, Monroe, Mich.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

THE largest single field of alfalfa in the world, comprising 5,000 acres, is in Nebraska.

IT is quite evident that there has been injected into the veins of the U. S. Revenue Department new ideas and standards as to its duty in enforcing the oleomargarine law. This, no doubt, is due to the force and influence the dairymen were seen to have in securing the passage of the law. Heretofore, the Revenue Department has paid no attention whatever to the safe-guards and regulations which the law threw about the traffic so it could not deceive the public. The officials eased their conscience by saying that their sole business was to collect revenue. But last month two men were convicted in St. Louis on the ground that they took off the wrapper that designated the stuff as oleomargarine. When arrested these men had the discarded wrapper in their pockets. Both were fined $200 and a short term of imprisonment.

As an example of building better than was expected, we have seen nothing happier of late than this item from the *Wisconsin Agriculturist*:

"Warm weather is trying weather for cows. The wife and considerate dairymen will do everything possible to add to their comfort, and consequently to his profit, at this time."

The typesetter who transformed wise into "wife" and the proof reader who failed to note the change, had no thought, probably, that the things essential for the comfort of cows are much more likely to suggest themselves to the wife than to the husband, or that the surest indication of a "considerate dairyman," is his willingness to accept and follow the advice of his wife in all those matters which make for the cows' comfort. While therefore the wise and "considerate dairyman" will do all he knows how to do for the comfort of his cows, it is also true that the combination of a "wife" with a "considerate dairyman" will do much better.

THE time is not far distant when the farmer of the middle west who is subject to the uncertainties of rainfall, will make irrigation a part of his farming operations and thereby obtain a certainty in crop growing that can be obtained in no other way.

The Wisconsin Station has been carrying on experiments in this line and reports that the cost of irrigation of the tracts used for the purposes of these experiments was $6.68 an acre, not including interest on the investment, but including all extra labor. There was obtained as a result of surface irrigation an increase of 2.5 tons per acre in the crops of clover hay; 29.95 bushels increase in corn and 83.9 bushels increase in potatoes. The figures indicate an apparently very large profit by the use of irrigation even in such a country as Wisconsin, where the rainfall is rarely seriously deficient, and where drouths are no more common than they are throughout the greater portion of the United States.

The official conclusion from the Wisconsin experiments is, that where water can be had and brought on the land without too serious an outlay, irrigation will add largely to the profits of intensive farming.

Similar experiments recently made in New Jersey have shown excellent success in the use of irrigation in the culture of small fruits and vegetables. Sandy soils, poor in plant food, which, by the use of manure alone, showed little increase in fertility, became very productive through the use of water in connection with the manure.

DR. Leonard Pearson, State Veterinarian of the Department of Agriculture, has been offered an appointment as a member of the Philadelphia Board of Health. The position carries no salary, but it will give the appointee an opportunity to render useful service to his commonwealth.

This offer of appointment is notable because it comes nearer giving milk producers representation on a city board of health than they have ever had before. It is well known that Dr. Pearson's sympathies are with milk producers and as a result of his efforts in their behalf, covering a long series of years, he has their confidence to an unusual degree. It will be remembered that, together with Dr. Gilliand, he has worked out at the University of Pennsylvania, and is now perfecting under the support of the State Live Stock Sanitary Board, a system for preventing tuberculosis of cattle by vaccination.

If Dr. Pearson decides that he can afford the time that the work of the Board of Health will require, and accepts the position offered him, it is to be confidently expected that his actions in relations to questions pertaining to the milk supply of Philadelphia will be progressive but reasonable, and in harmony with the best interests of producers of good, clean milk. As in his work for the State Live Stock Sanitary Board, he will, no doubt, wish to receive suggestions and have made known to him the observations and opinions of practical men in the milk trade. This alone will be a distinct advance, because heretofore the Boards of Health of cities have not given much consideration to the needs or wishes of dairymen.

ALFALFA FOR BROOD SOWS.

Bro. Wallace of the *Farmer* advises siloing alfalfa to winter brood sows on. Here is a bit of personal experience. Last fall the Senior editor of the DAIRYMAN commenced feeding nine brood sows on alfalfa hay and their drink. This was continued all winter, the sows keeping in fine condition. These nine sows had 78 pigs with only one "titman" in the lot, and we have raised 75 weaned pigs to the present time. We never had sows yield milk as abundantly, and never raised a lot of pigs which showed as much vigor, right from the start. The cost of wintering did not exceed $1.50 per animal. They did not receive a particle of grain food during their wintering period. There is nothing finer for the production of strong, active pigs than alfalfa hay.

THE PRICE OF COWS.

Throughout all of the dairy states east and west, the word comes that cows are unusually high. In New York and New England, good fair cows sell quickly at $50 to $60 a head. Not only are prices well up, but the fact is, good cows are scarce and hard to find. The buyers from the Elgin district look for big, beefy cows that they can feed for a few months at a heavy rate, get what milk they can and then sell them for beef. The consequence is, these buyers do not establish a market for profitable dairy cows. A cow might give 50 pounds of milk a day testing 5 per cent but if she is under 1,000 lbs. in weight, the buyer will not pay as much for her as he would for a big beefy thing, giving not more than 20 lbs. of milk testing 3 per cent. There is no dairy sense or dairy judgment or dairy progress in such a senseless condition of things. It is demoralizing in its effect. Farmers who think and act on the spur of the moment are apt to believe that the Elgin brand is the right kind of cows for a dairyman to produce. We have known of certain farmers who have followed this idea out to the extent of placing a heavy beef bull at the head of their herd, composed of cows that they had carefully bred up to a first-class stage of production. These men did not stop to consider that there were already enough poor cows in the country, and what was really wanted was a cow that would pay a big profit at the pail. There has been a marked reduction of the stock of cows all over the country owing to the high prices of beef as well as the high prices of feed. Now is a capital time for the bright, intelligent dairy farmer to turn his attention to the raising of likely grade Jersey, Guernsey, Holstein, or Aryshire heifer calves. There is nothing one can feed their skim milk to that will pay a bigger return than nice heifer calves.

TRUE THEORIES IN BREEDING.

Dr. Kitchen reasons well in the *Jersey Bulletin* of June 24 on this craze for a few phenomenal high producers in dairy cattle. He holds to sound physiological sense when he says that the transmission of desirable qualities depends not so much on the immediate sire and dam, as it does upon the *number of desirable* sires and dams that lay back of the last generation. Therefore it follows that a study of pedigree and the performance of the animals that constitute that pedigree is the supreme thing when we are looking for good producers.

The Doctor says: "An animal is produced in the likeness of what is an average of *all* of the potencies and tendencies of all its ancestry." He figures that only about one-eighth of that likeness comes from the dam on an average, and another eighth comes from the sire, "while the balance comes from ancestry more remote."

This we believe to be sound doctrine. Each succeeding father and mother are like pieces of tile adding to the channel down which flows the desired traits and tendencies. Of course it is important that constant care be had in the selection of parents on both sides, to do all we can to gradually enlarge the channel. That is all we can do. Any increase of capacity must come slowly, for if we study the channel we will find that enlargement has *always* increased slowly.

These principles should teach all men who breed dairy cattle that a study of pedigree and the performance of the fathers and mothers in that pedigree, is very important. Often we hear men say: "O, I don't care anything for pedigree; what I look after is the individual character of the animal." It is very easy to go half-dressed in this matter. Individual merit is good and important, but it is only a sign that the animal has inherited well. If the animal is to convey value, it must have as near as possible an unbroken channel of heredity in good qualities to draw upon, and the *larger* and *longer* the channel, the more likely will it be to get what we want.

This principle in breeding shows how unwise those farmers are who cross here and cross there, breaking up the line of descent all they can, under the notion that breeding is like making soup—a hodge-podge of everything.

No breed of farm animals ever was or ever can be established in that way. Nature, while very indulgent, sets bars and limitations. She works slowly but in *straight* lines, holding certain characteristics chief all the time. In cattle, the "hodge-podge" breed is but the extension of the "dual-purpose" to its final logic. If we breed to the enlargement of dairy qualities, we must hold to dairy qualities as our chief purpose.

EXPERIENCE IN ALFALFA ON HOARD'S DAIRYMAN FARM.

This year we are harvesting about 32 acres in alfalfa, and some of the things we have learned may be of service to the readers of the DAIRYMAN. It will be remembered that we have repeatedly cautioned our readers to leave a strong, heavy growth on the field in the fall, and this especially for all growers in this northern latitude. Last fall the fourth crop came on finely, and our foreman thought if it was cut it would renew again in time to afford ample protection for the winter. In one field of 8 acres in our absence he had cut around the outside, covering about five acres. On our return we asked him to leave a square piece of about three acres in the center uncut.

When spring came it was seen that the portion of the field that was cut was seriously injured, but the center showed no injury whatever. We accordingly ploughed up the cut portion, leaving the center 3 acres to the growth of alfalfa. The breaking up was another lesson. It required a team of three heavy horses, and the roots of alfalfa showed like coarse stubble all over the ploughed portion. But the effect of the alfalfa on the mechanical condition of the soil was a revelation. The ground ploughed like an ash heap. The field had been in alfalfa four years, bearing three heavy crops each year. It had never been dressed with manure, though it had had two tons of commercial fertilizers and two dressings of wood ashes. The ploughed portion was sown with a bushel and a half of oats to the acre and re-seeded to alfalfa. The stand of oats at the present time is the finest and most even that we have ever produced, some estimating a production of 80 bushels per acre. The soil is a heavy clay and appears to have been broken up to a great depth by the alfalfa roots. We estimate that the weight of roots to the acre is over six tons.

The portion remaining in the center, about three acres, has produced a very heavy crop this year, fully three tons to acre the first cutting.

From this experience we conclude as follows:

(1) In this latitude the fourth crop should always be allowed to stand on the field as a winter and spring protection, unless it is intended to plough up the field.

(2) The effect of alfalfa on the land is to greatly break up and fine the soil besides adding greatly to its fertility in the same manner, but greatly in excess of clover.

(3) As a rotation of crops alfalfa is a

decidedly economic success. We propose to go over the whole of our arable land with alfalfa, in rotation. It is vastly cheaper than barn yard manure and many times more effective. It requires 30 lbs. of seed to the acre, worth, say 12 cents a lb. This is $3.60 an acre. Can any man haul manure to the same amount of fertility that alfalfa will give for $3.60 an acre? We expect to break up 15 acres of alfalfa the coming fall for corn next spring and shall seed a like amount of present corn ground. Our experience with the carrying of nine brood sows all winter on alfalfa hay and the effect on the pig crop is recorded in another place in this issue.

A MEATY AND INSTRUCTIVE LETTER.

Sometimes we get informal letters from our subscribers which tell a very instructive story of dairy experience. The facts of human experience are always interesting to study, for often they tell us what to avoid as well as adopt.

The following excerpt is taken from a letter received from Mr. G. L. Poole, of Wellsfield, Ohio:

ED. HOARD'S DAIRYMAN:—I rented a cow, three years old, of a man last winter and gave him one-third of what her milk came to as the rental. I kept her 101 days and paid the owner as his share $42.70. Now he thinks I know a whole lot about feeding and has told the master of a neighboring grange about it, and they want me to come over some night and tell them about it.

There will be about 15 silos built in this Middlefield township this summer. We are located in easy access to Cleveland by the electric railroad.

I am in hopes I can stir up a little dairy enthusiasm and desire for better ideas here by using HOARD'S DAIRYMAN for a spoon. Anyway I shall hammer away at them on the ideas of weighing each cow's milk, looking after the cow's comfort, feeding a balanced ration, breeding to a good sire, training heifers to be persistent milkers and the greater profit in winter dairying. I am making preparations to keep 15 or 20 cows next summer, and as I only have a 56-acre farm it will require some extra work and good planning to make things come out right. I sowed a patch of oats and peas the middle of March, and June 21 I began to feed. They were 3 to 5 feet high. I measured four square feet of ground and weighed them. They weighed 15½ ounces to the foot or over 20 tons per acre. At that rate it would seem oats and peas would hustle corn to be king.

I cannot express the benefit in pleasure, as well as cash profit, I have received in studying HOARD'S DAIRYMAN. I am sorry I did not begin sooner, but as I am only 28 years of age perhaps I will have it to read a good while yet.

P. S. I wish you would have a cheese factory patron investigation taken in this locality. If I was investigated it would read something like this: Patron No. 1—Has a herd of 10 cows, grade Holsteins. Cost of keeping for one year, $34.50; milk yield, 5,636 lbs. per cow. Returns from cheese factory (8 months) and shipping milk to city (4 months) $58.91. Winter ration consists of 35 lbs. ensilage, 6 lbs. corn stover, 7 lbs. gluten feed and bran. Summer ration consists of pasture, soiling crops and 3 pounds of bran. Basement stable; moderately warm, well lighted, but no especial system of ventilation. Tight gutters, and horse manure used as an absorbent. Manure handled in the winter as convenient. Raise my best heifer calves to keep up the herd, and use *always* a registered bull. No abortion. Reads HOARD'S DAIRYMAN and agricultural papers. After selling out 3 culls, the remaining 7 cows averaged $70.18 apiece, and three of them were 2-year-old heifers.

The above statement shows what it does for a farmer when his brains, as well as his hands, are enlisted in his own behalf. Mr. Poole has not neglected the brain side of the problem. We venture one suggestion, and that is, that he purchase a couple tons of land plaster and sprinkle the horse manure in the gutters when first it is placed there. We find it very valuable.

A Vermont Barn—Suggestions for Ventilation Wanted.

ED. HOARD'S DAIRYMAN:—I have noticed articles in your valuable paper from time to time, in regard to barn ventilation but I am unable to obtain the information from the files I have, that I want. I have a new barn that will stable 45 to 50 cows, and I want to ventilate the stable as it ought to be. I enclose plan of barn and stable drawn roughly. If you can from these sketches get an idea of the barn and can give me a plan for ventilation or put me on track of such information, I will gladiy pay you for your trouble. Barns of this kind steam up badly in cold weather and the roofs fairly drip and wet the hay when weather warms up. I have put no cupola on the barn yet and will not until I decide upon a plan of ventilation.

My two hay chutes will be located as indicated in the enclosed plan, and will run well up above the level of the plates andcan be extended to the roof, if I can use them in my plan for ventilation, connecting them with the cupola. I placed them back of the center of the bays to make it easier to get the hay out. The side next to the floor will always be the highest and the location of the chute will thus make it easier to get the hay out, than if the chute was placed next to the floor as is usually done.

Franklin, Vt. C. W. GATES.

The sketches enclosed with this letter show a structure 75 feet long by 44 feet in width and provide for a basement 8 feet in the clear, and 22 foot posts above this to the plates. Apparently, it is intended to make a three-story structure, driving into the barn on the third floor, which is to be four feet below the plates. In the basement stable, the sketch shows 8 feet in width, lengthwise of the center, devoted to a feeding alley and mangers, with a row of cows fastened in stanchions on either side. The hay chutes referred to are above this alley and located about 8 feet from either end—the bays on either side of the barn floor, being 30 feet wide.

It is to be regretted, we think, that this correspondent did not consider with more care the plans for this structure. In a barn 75 feet long, there will be only about 142 linear feet for stabling cows and providing passage ways. There should be at least three of these passages on either side, each three feet wide, which will take 18 feet from our 142, leaving only 124 feet available for stalls. Unless they are considerably undersized, this will not accomodate 40 cows comfortably. We think it preferable to allow not less than 3½ feet in width for each cow, and then with a partition between each two cows, there will not be more than three feet and three inches clear space. We consider the partitions practically indispensable, although, we regret to say, they are found as yet in comparatively few stables. The absence of partitions is the prolific source of injury to udders and teats.

This correspondent seems to be of the opinion that, in some way, it will be practicable to use the hay chutes as ventilators. This is another mistake all too frequently made in barn and stable construction. They might do very well for summer use, but in the winter, in our nothern climate, the ventilating shaft should open on a level with the floor, as has been explained so frequently of late in these columns. We need pure air in the stable and a fair degree of warmth. If the ventilating flue opens at the top of the stable, it affords a ready and complete exit for the heat generated by the bodies of the animals and all the cold there is in the stable settles to the floor. With the opening into the ventilating shaft on a level with the floor, the cold and impure air in the stable is drawn off and the warmer air at the ceiling comes down to replace it. The converse of this plan applies for the introduction of fresh, cool or cold air from the outside. This should be admitted at the ceiling as far away from the cows as possible, be distributed quite evenly all over the stable, so that the temperature throughout may be fairly uniform. The openings for admitting this fresh air should not be direct from outside to inside like a window, but the exterior opening should be not less than three feet lower than the interior opening, and the two connected by a flue. Otherwise, the warm air at the top of the stable would escape through these openings, with the result that we would have a cold uncomfortable place for cows to stand and lie down.

We are in somewhat of a quandary as to the proper location for a ventilating shaft or shafts. A large central shaft, if not too much in the way, might be locaed at one end of the feeding alley and run straight up through the ridge of the barn, or if preferable, two shafts or flues could be built in opposite corners, run up through the bays to the roof, then slant and come together to a single flue through the ridge in the center. There should be not less than four square feet of cross section in these flues for each twenty head of stock in the stable. If only one flue is built, it should be not less than two and one-half feet by four feet inside measurements and this flue should be as air proof throughout its whole extent, as a chimney in a dwelling house.

If this correspondent had planned a barn only 36 feet in width by 90 feet in length, he would have enclosed the same number of square feet, but in much better shape for practical use on a dairy farm.

Alfalfa as a Fertilizer.

The great value of alfalfa as a feeding stuff, especially in the Western and Southern States, is well understood. This has been established by long practical experience and by the scientific investigations of a number of the experiment stations. These investigations have not only demonstrated its value as a feed for all kinds of stock, including pigs and poultry, but have shown the stage of growth at which the plant contains the greatest amount of nutritive material and the best ways of curing and ensiling the crop. The value of alfalfa as a fertilizer has, perhaps, not received so much attention, although a number of stations have investigated this phase of the subject. Professor Buffum, of the Wyoming Station, has shown that the crop is especially valuable for increasing the nitrogen of soils of the arid or semi-arid region for improving the tilth, and for destroying weeds by crowding them out. In experiments at this station it was found that land which had previously been in alfalfa produced $8 to $12 more value in wheat, $16 worth more of oats, and $16 worth more of potatoes per acre than land which had grown potatoes and grain before, and these "increases of yield and value were produced with absolutely no cost for fertizing the land.

The results were obtained on land which had been in alfalfa five years, the crop being cut for hay each year, leaving nothing but the stubble and roots in the soil.

According to analyses reported by the Colorado Station, a ton of alfalfa hay contains 44 pounds of nitrogen, 8.27 pounds of phosphoric acid, 50.95 pounds of potash, and 40 pounds of lime. Alfalfa is a leguminous plant, and is therefore able to draw the larger part of its nitrogen from the air, thus causing an actual increase of nitrogen in the soil. It can readily be seen from the above figures that if the alfalfa is turned under, a considerable increase in the available fertility will result, but even if the crop is removed the soil is improved in tilth and fertility by the shading of the ground and the decay of the large deep-growing roots of the plant, as was demonstrated in the experiments above referred to.—*Farmers' Bulletin No. 133.*

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Oats or Oat Hay.

Which is the best way to cut oats? Is it better to cut them green or to wait until they are ripe then cut them and have them threshed? Which would give the most milk? Our hay crop is very light this year. S. T. R.
DeRuyter, N. Y.

Under the conditions stated we should prefer to make the crop into hay.

Effect of Stirring Milk on Fat Test.

I have been told by several people that when milk is just cooled off, it should be stirred thoroughly, on account of having a higher test. Is this so or not? I take my milk to the factory, and it goes by test. J. F. S.
Haven, Wis.

Stirring the milk can have no effect on the fat test as the fat can be neither increased nor lessened by any mechanical action. The milk is stirred to aid in cooling it more rapidly, which has a decided influence on its quality when made up into butter or cheese. It should also be thoroughly mixed by stirring or pouring when the sample is taken, in order that the sample may be an accurate representative of the whole mass.

Prof. Dean's Acidimeter—The Alkaline Test.

Is the Acidimeter mentioned by Prof. H. H. Dean in article in your paper on page 376, issue of May 29th, 1903, the same Acidimeter sent out by supply houses for testing the strenght of acid for testing milk. J. L. C.
Plainview, Neb.

The acidimeter sold for the purpose of testing sulphuric acid, is an instrument for ascertaining the specific gravity of a liquid. The acidimeter proposed by Prof. Dean is an alkaline solution that is used to test the small amount of lactic acid that is found in milk and whey. Farrington's alkaline tablets or Mann's test solution are used for this purpose. These are frequently called the alkaline test because the solutions are alkaline, but they should be called the acid test as they determine the amount of acid in milk or whey.

Has Great Difficulty in Keeping Ice.

I have an ice-house that I have a great difficulty in keeping ice in. The house is 12x16; posts 12 feet; slate roof; lined under rafters to keep off heat from roof: ventilated at eaves of roof; foundation, stone 3½ feet high, laid with lime and sand. This house joins another of same size, filled in with saw dust, and has an air space of 6 inches between siding and the saw dust filling. I cover the ice heavy with saw dust. In filling the house I place poles in the bottom, cover with straw then saw dust; then it is ready for the ice. I have tried different ways of filling it: I put tile in the bottom and out through wall. Now, if you can give me any information on the matter, I would be glad to pay you for it. This building is sided up and down with matched siding. Have you any book on the building of ice-houses? C. S.
Delaware, N. Y.

There may be several contributing causes to the excessive waste of ice complained of. It is possible that our correspondent uses too much covering on the top and sides, but from the description given, we are lead to believe that the more serious fault lies, possibly, in the drain tile which leads out through the wall. Drains from ice houses should be so securely trapped as to prevent all possibility of an ingress of air from the outside to the bottom of the ice.

We have no book which treats of the construction of ice-houses.

Per Cent and Value of Butter Fat.

Kindly give me the value of butter fat.

1. One cow giving 40 pounds of milk per day, testing 5 per cent butter fat.
2. One giving 38 pounds of milk per day, testing 4.6 per cent butter fat.
3. One giving 30 pounds of milk per day, testing 5.4 per cent butter fat.

Will you also kindly give me the value of fat per day at 25 cents per lb? P. H. R.
Egypt, Mass.

The 40 lbs. of 5 per cent milk contains 2 lbs. of fat of a value of 50 cents; 38 lbs. of 4.6 per cent milk contains 1.75 lbs. fat, value 43.7 cents; 30 lbs. 5.4 per cent, contains 1.62 lbs. of fat, value, 40.5 cents.

A Foundation Wall for Silo.

Am thinking of building a silo; am going to put up one 15×30, four feet of it will be in the ground. How thick ought the wall to be, and ought it to be laid up in cement or laid up dry and plastered over with a good coat of cement? A. J. McL.
Buskirk, N. Y.

A very light foundation wall answers every purpose for a silo. Make this wall as narrow as can conveniently be laid up. If brick were used, eight inches or a foot would suffice, but if stone, it will be difficult to make a good wall less than about 18 inches wide. The wall should be laid up in mortar, not necessarily cement mortar, but plastered on the inside, however, with good cement mortar.

Rye Gluten Feed.

Will you please state in your next issue the value of rye gluten feed as a milk producer? I can get this at $18; bran at $18; gluten meal, $25; corn, $17. L. R.
North Olmstead, O.

Rye gluten feed as such has not yet found a place in any of the tables of feeding analyses. Presumably, this feed is a distillery by-product and if in good condition and thoroughly kiln dried, should make a good feed and would be relatively cheap at the price named. In buying any of these feeds with the new names, a guaranteed analysis should be insisted upon.

Plan Wanted for a California Barn.

I have read that you have published plans of farm barns, and as I want to build one about 48x 50 feet, to accommodate about 10 or 12 head of stock and storage for hay and want to do it right, I would like to get a suitable plan, and ask you to send me such sketches as will meet my want. I do not know whether your plans were published in the DAIRYMAN or in book form, but if you will send me a copy at once I will send you the money on receipt. Which is preferable for hitching cows in stalls, halters or stanchions?

Los Angeles, Cal. J. K. MOORE.

We have published a great many plans for barns in recent years, but nothing, so far as we now remember, which would seem to meet the requirements of this inquirer. Indeed, it is difficult to determine from what he has written just what sort of a structure would probably best suit him. One of the important questions would be whether this was to be a farm barn or a city barn, whether the hay to be stored is loose or in bales, whether there is to be an old fashioned barn floor or what. In a general way, we might say that a structure 48 feet wide by 50 feet long does not seem to us to present the best arrangement, and yet, it may be exactly what this inquirer wants. A stable across one end of the barn, 14 feet wide would afford stall room for his 12 head of stock and this would leave something like 30 to 32 for a barn floor, if one is needed, and a mow for storing hay. It is, however, about time that the old fashioned barn floor should be dispensed with. It was used by our forefathers as a threshing floor before the introduction of threshing machines, but in the modern barn it takes a good deal of space that might be used with more profit for other purposes.

It is quite possible that this inquirer would find valuable suggestions in Prof. King's book entitled "Physics of Agriculture." This book, not only gives plans of barns and other farm structures, but, as its title implies, contains much other valuable information concerning the problems which are continually confronting the farmer. The publisher's price of the book is $1.75, and by special arrangement, we are able to furnish it, postage paid on receipt of that amount. Rigid stanchions cannot be approved. Some form of swing stanchion or one of the stalls advertised in this paper should be used.

Where Is the Loss of Fat?

I am bringing cream to a creamery but it seems to me that I am not getting as much money out of my business as I ought to. In month of May I brought to creamery 441¼ lbs. cream; test was 27½ which gave 121 lbs. butter fat at 22½c amounting to $27.31.

I am weighing my milk at every milking and had during month 3310 lbs. milk. I took sample of milk during month, of every milking from each cow

One cow tested	3.30	giving	lbs.	milk.....	1004
" " "	3.70	"	"	"	1016
" " "	4.90	"	"	"	 636
" " "	4.80	"	"	"	 804
Total.....					3460
Used at home.....					150
Run through separator...					3310

The milk was tested by the buttermaker. Now the best way I can figure I am the looser of $2.48 but can't make out where the loss comes in unless it should be in separating.

They paid at creamery 90c for 4 per cent milk and price of butter was 20.85 cts; N. T. L.

Iola, Wis.

From the figures given, we find that the average amount of fat in this milk was 4.06%, and if the separator worked properly, should have yielded 132 pounds of butter fat in the cream. It is, of course, impossible for us to say whether the discrepancy in the actual test of the cream resulted from faulty separation or improper sampling of the cream. The inquirer should have had his skim milk tested to ascertain whether his separator was doing proper work, and this not for one or two days only, but for several days in succession. If it should be found that the separator was doing its work properly, then the manner of taking the sample and testing the cream should be investigated. By the laws of Wisconsin, it is forbidden to take cream samples with a pipette, but they must be weighed out, fully 18 grams.

If the creamery pays 90c for 4% milk, it is paying at the rate of 22½c per pound for butter fat.

Buckwheat for Silage.

Will you kindly through your valuable paper inform me if buckwheat can be successfully siloed, and if ensilage will make good feed for fattening steers and at what stage of maturity should it be put in the silo? S. K. H.

Carroll Co., Md.

We have never heard of any attempt to preserve buckwheat forage in the silo. Undoubtedly, it could be very succeesfully siloed, but just what would be the quality of the resulting silage is an entirely different problem. It would doubtless be very much like the green forage, just as corn silage corresponds very closely with the green corn as it is cut from the field, or clover silage resembles green clover. If our correspondent has had any experience in feeding green buckwheat to steers, he can form an approximate estimate of the feeding value of the resulting silage. Possibly, some of our readers may have tried putting buckwheat into the silo. If so, we should be very glad to have them report results. The buckwheat should be cut for silage sometime before the stalks get too dry and woody.

Yields Less This Year Than Last Year.

A. B. W. of Raleigh, N. C., writes as follows:

Please tell me why my cows do not improve after first calf? They have more pasture now than last year and as good feed. I feed cotton seed meal, wheat bran and cotton seed hulls, but do not get as much milk and butter.

It is perhaps natural that this inquirer should submit such a question, but probably with little expectation that we could return him a very satisfactory answer. There are a good many perplexing experiences which meet the dairyman on every hand. The quality of milk given by individual cows may vary widely from day to day, and we are yet without any means of ascertaining the cause for it in many instances. So too, cows will sometimes do extra well one season and very poor the next season and *vice versa*. As we have quoted elsewhere, a notable illustration of this variation in yield is given in the report of the Wisconsin Experiment Station, for 1900, where a cow yielding only 110 pounds of butter in one year, yields the next year 324 lbs. We cannot say that such differences are incredible because they have been observed too often to admit of any question, but they are not explainable. We cannot tell why there should be such a variation. It is a very common thing to compare the milking cow with a machine. In a sense, she is a machine, but she is very different from the ordinary wood and iron machines that are driven by power. She is a nervous entity, a phenomenon.

As a mere guess, we are disposed to think that possibly these heifers were over-worked during their first year of lactation and are recouping for this by the great falling off in yield noted this year.

The Chippewa Valley Creamery Company, at Chippewa Falls, is receiving about 4,000 pounds of cream daily and had during the month of May last, 215 patrons, all of them using farm separators. One of the instructors of the Wis-

"ADVERTISEMENT".

"DABSTERS"

People Who Do Things by Piecemeal.

Many people are convinced coffee is the cause of their sufferings and stop its use from time to time to get relief. During these periods when they are not drinking coffee they feel better. They are getting well in small installments.

How much better it is to stop short on the coffee and shift to well made Postum and get well once and for all. As soon as this is done the destroying effects of coffee are stopped and a powerful rebuilding agent is set to work. Health comes back by bounds and so long as the right food and drink are used and improper food is left alone the cure is permanent.

A lady of Readfield, Me., says: "I was always a great lover of coffee and drank it so steadily that I would have to stop it at times on account of dizziness in my head, gas in the stomach and other troubles. I would leave off the coffee for a few weeks until I felt better, then would go to drinking it again.

"I continued this for years and paid dearly for it, until about a year ago I read a Postum Cereal article and bought and carefully prepared some. It filled the place of coffee from the start so far as flavor and taste go and it has righted my stomach troubles. I have improved so that my friends notice the change. I have exchanged sickness and misery for health and happiness. Through Postum I have got well all at once." Name furnished by Postum Co., Battle Creek, Mich.

Ice cold Postum with a dash of lemon is a delightful "cooler" for warm days.

Send for particulars by mail of extension of time on the $7,500.00 cooks contest for 735 money prizes.

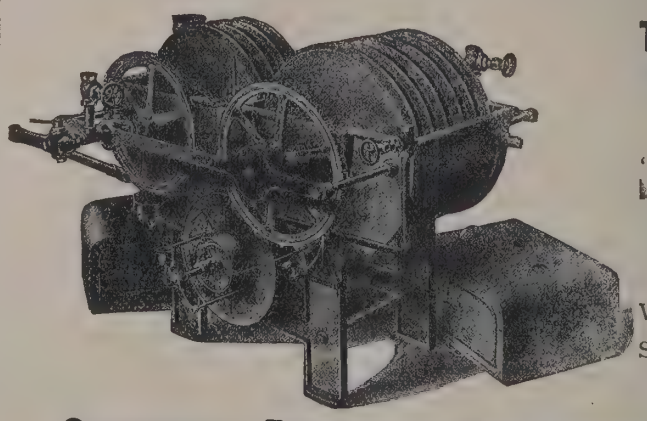
U. S. CREAM SEPARATOR

Excels Everything at the Kansas State College

Read carefully Press Bulletin, No. 123, issued May 26th, 1903.

The U. S. Separator excelled the five other separators in the competition, but we refer to one only in this space, viz: our "would be competitors."

De Laval average test of skim-milk, .048
U. S. " " " .033
U. S. excels De Laval - - - - .015



This shows that the De Laval Separator left 45 per cent more butter-fat in the skimmed milk than the U. S.

These tests substantiate former records and are continued proofs that the U. S. IS THE MOST THOROUGH SKIMMER IN THE WORLD.

DILLON-GRISWOLD WIRE CO., Sterling, Ill.

consin Dairymen's Association visited this creamery recently and reports the condition of all the cream from these separators as good. One reason for this perhaps is a little card which is furnished to every person shipping them cream, bearing on one side the following directions in regard to caring for the milk and the cream:

THE MILK.

1. Always strain your milk before separating.
2. Separate as soon as possible after drawing from the cows.
3. Feed the skim milk to the calves and pigs as soon as separating is done.

THE CREAM.

1. Always have a clean receptacle to catch the cream.
2. Cool the cream as rapidly as possible by stirring, with the can either in the cold air or in cool fresh water.
3. Note! Note! Never put two batches of cream together until each has been thoroughly cooled.
4. Weigh your cream on a good scale. Take a good sample and apply the Babcock test before shipping, and if anything looks wrong, please let us know.

On the reverse side of the card appears the following:

DEAR SIR—In presenting you with this little card, it is our object to show you briefly as possible how to make farming profitable, and where the leaks are. We urgently request you to read and study every item and judge for yourself our sincerity in working to your interests. What we know and want you to know is that the most profitable business on the farm is dairying, and it is a cash business; that the most practical and economical way is to separate your milk on the farm as soon as you are through milking; that a superior quality of butter is made from cream handled in this way. Hence the better results.

This is what we have paid for the last 6 months for butter fat: Nov., 25c; Dec., 27c; Jan. 25½c; Feb., 25c; March, 26½c; April, 24½c; Average: 25 85-100c.

Heredity and Environment.

In an address on this subject before the Missouri Improved Live Stock Breeders' Association, Benton Gabbert, of that state, said among other things:

These two great factors cover the entire field, not only in cattle, but in all plant and animal life, including the human family as well. Heredity is the transmitting of traits, both good and bad, from ancestors. This is the great law of nature. In fact, outside of collected data and personal knowledge, it is as self-evident a fact as two and two make four, for from whence or where could the offspring derive its individuality if not from its progenitors? And this law of heredity is retroactive, not the first parents giving all, but the power of transmission, running back in some instances to remote ancestors.

Take a tabulated pedigree, and you will see that the genealogical tree branches from one trunk to two forks, to four limbs, to eight branches, and on, widening, if there is no line breeding, almost indefinitely, and any one of these branches may crop out, and this cropping out, if very pronounced, is called atavism. Just why atavism occurs no one knows. The most probable solution, to my thinking, must be some corresponding environment, similar to the remote ancestors, and mating where prepotent blood lines lead back.

Nature in her great law of the survival of the fittest should teach us a lesson in breeding. The law of heredity, or the old maxim, that like produces like, has built up our pedigrees, a good law to hold to, but not infallible. We see the animal, or should, before we trace the pedigree, and if the pedigree is satisfactory, that is the animal for our herd. But with some the pedigree is first, the individual excellence of the animal second. Now the one who chooses from pedigree places too much value on remote ancestry. From my observation and experience, the culmination of heredity should be in the good qualities of the animal you are selecting; the two should go hand in hand, a good animal and a good pedigree; then you have assurance doubly sure that your animal will be prepotent; generally, prepotency can be expected only from a union of this kind.

This power of prepotency sometimes ceases with the animal; the offspring are all that you could desire, but the power of transmission does not reach to the third generation. We see this in all breeds and that family drops out of the first ranks soon enough to keep the pedigree crank from spoiling many good herds, but, as a general rule, the prepotent animal transmits the same qualities to the offspring, and they breed on and on; then pedigee becomes a talisman for a good animal.

We now reach a problem in breeding that is a difficult one to solve, one about which our best breeders differ, one which the most successful breeders practice, yet most all breeders condemn. I refer to lines of breeding, or breeding animals of same blood lines so blended that some tabulated pedigrees have the same blood lines in most every cross. In starting the pure-bred herds of all the breeds, inbreeding was resorted to from necessity in forming a type. Even now it is closely follwed by some breeders making a type, so that any good judge can pick out in a large show ring the different breeders' cattle, by type. There is much to be said both for and against line breeding.

The best herds have at their head some great sire, with his sons and grandsons in service. In fact, I cannot now recall a noted breeder either at home or abroad who has changed his herd bull every two years, or one who has bought his cows in preference to raising them, that has succeeded in reaching the top or in establishing a distinct type.

Out-crosses generally help the first cross, but subsequent crosses deteriorate. For this rule we have no less authority than Darwin. We think the same rule holds good in breed lines; that is, in crossing families of the same breed; but if these families nick I would seek no farther, but would prefer these two families rather than try a third family. I would term the inter-crossing of these two families, line breeding. In-breeding I would define as taking a great sire and breeding in-and-in with his progeny. This process produces some very superior individuals, with a great many not so good.

We condemn this course of line or in-breeding more from our prohibiting by law such relations in the human family than from an observance of Nature's teachings. The wild animals in a state of nature necessarily in-breed, yet we have some fine specimens.

The wild horse, through the survival of the fittest, keeps the herd in splendid form. The best stallion, in their stampedes from wild animals, is followed by the fleetest mare; with vicious bite and heels of fire he guards his harem, until the young son, more robust, takes his place.

When we consider environment, it is so closely allied to heredity that the proper treatment of a herd makes environment almost the parent of heredity. Were it not so, there could be no progress. The fine herds of today owe their superiority to proper handling for generations. It is the selecting and mating of the best, and giving those feeds judiciously that build up a healthy animal, that transmits environment.

Environment can, through necessity, model the form. Darwin tells us that the long neck of the giraffe came by selection through environment. The giraffe is a habitant of Africa where severe drouths occur every few years. The herbage is burned up and the giraffe feeds upon the leaves of the trees; those with the longest necks alone survive; these in turn meet succeeding drouths, and this gave the giraffe his elongated neck. I am more and more convinced, from reading and actual observation, that more herds retrograde from being under-fed than from being over-fed. We hear criticisms from our best farm journals against the practice of over-fattening our show animals, yet the fat animal nine times out of ten goes to the front; and I make this assertion and, if you think awhile, I believe you will agree with me, that the herds that are most successful at the fairs have for herdsmen the best feeders and fitters. In fact, in the beef breeds we expect fleshing qualities. The general verdict of the ring side is always for the animal in perfect bloom. The feeder's art has been taxed to the utmost to bring the animal to perfection, and if he fails, the fault is lodged against the animal and not the fitter. Between a perfect form in a skeleton, and rare fleshing qualities with a lack of symmetry, we would always take for a feeding steer the fleshing qualities.

A Colorado Feeding Problem.

Fly Pest Remedies.

ED. HOARD'S DAIRYMAN:—Under separate cover I am sending you a sample of the grain I am now feeding. It is shipped in from Nebraska and is supposed to be the albuminous part of corn mixed with oats. I like it well and prefer it to corn chop. Am also feeding with it linseed meal.

Can you formulate me a ration with this and cotton seed meal or linseed meal and all the alfalfa the cows will eat? In your issue of June 26th, page 474, I notice a table by Mr. H. E. Cook. It seems to me that ½ ton cotton seed meal to 1½ tons chop is a very heavy feed. I am milking 36 cows and feed about 400 lbs. grain per day. Practically we have no pastures and depend upon feeding in summer much as in winter. This mixed feed costs me about $1 per hundred; cotton seed meal and linseed meal $30 per ton. Mr. Cook's table looks good to me and I want to find out if you would advise putting in a ton of bran to increase, as he says, the bulk and ash content.

Perhaps you will find on examination of this chop that I require neither the linseed nor the cotton seed meals.

If there is any expense attached to analysis, or in any other way, let me know and I will remit by return mail.

Do you take any stock in the fly-killer advertisements in your paper? If so, kindly let me know and I am willing to try anything if it will only keep away the flies. G. McC.

Denver, Colo.

We have no appliances for making analyses of feeding stuffs and do not think it advisable to provide such appliances, or even to act as intermediaries in securing analyses of feeding stuffs from other States, as this is a matter which should be attended to by the Agricultural Colleges and experiment stations, each for its own State.

The final test of every feeding stuff is determined by its use and the effects produced. If on trial this mixed feed or by-product is producing better results than could be had with the same amount of money invested in pure corn chop or ground oats, or other feeds obtainable in Colorado, there is no reason why it should not be used.

With plenty of good alfalfa hay, one does not need to look elsewhere for feeds like cotton seed meal, linseed oil meal and others containing large proportions of protein. Alfalfa hay contains practically all of the protein needed, and if the cow could eat and digest enough of it to supply sufficient nutriment for maintenance, and the production of milk in profitable amounts, no grain would be needed. But as she cannot do this, we think it advisable to add some more concentrated feed. Theoretically, ground corn would be the most appropriate complement to feed with alfalfa hay, but ground corn is too concentrated to be fed alone, and therefore, should be diluted, or, as we sometimes say, extended, with bran or chaffed hay or straw or oats. The only necessity we see for using linseed meal would be for its hygienic effect, if any was needed. This can only be determined from time to time by careful watching of the herd and its individual members.

We should consider 400 pounds of grain per day to 36 cows, extra heavy feeding and probably more than could be made profitable. Doubtless, some cows in the herd could eat grain at this rate and return a good profit, but it would be a very extra herd indeed that could take, on an average, 10 lbs. of grain per day. In other words, cows should be fed as individuals and no more be given to any cow than she could give a good account for in the pail. This implies the careful weighing of the milk every day and keeping a record of it that can be referred to in connection with the amount of grain fed.

In regard to the fly repellents advertised in our columns, we can only say that we have tried some of them with very great satisfaction. Whether they would answer a similar purpose with the fly pests in Colorado, we cannot say, but we apprehend that any one of these advertisers would be more than willing to send a sample at wholesale rates for trial.

Some Florida Feeding Problems.

The Protein Problem and Cotton Seed Products.

ED. HOARD'S DAIRYMAN:—One of the best grain feeds we have for this climate is distillers dried grain. It is bulky, as well as palatable. All kinds of stock eat it with a relish. Being kiln dried, it keeps very much longer in this climate than our mill feeds.

We bought last February in Southern Kansas a car load of alfalfa hay, and we find difficulty—in fact, we have not been able to compound a balanced ration. While feeding alfalfa, both our grain and hay are so high in protein that instead of 1 to 5.6, we can only get 1 to 4 in feeding the quantity we think necessary. We give our milch cows all they will eat, which is about 8 lbs., per day, of hay, with a pasture run of Bermuda grass, but the pasture is small for so many cows, and that does not cut much of a figure in the feeding problem.

With distillers dried grain at $30.00; feed meal, $26.50; wheat bran, $24.50; cotton seed meal, $26.50; cotton seed hulls, $9.00; alfalfa hay, $23.00, let us see how you would formulate a ration that will be both economical and wholesome and yet be a balanced ration. Our cows are Jersey grades, medium size, averaging 8 quarts. Most of them calved in mid-winter and due to calve late next fall. One fresh, calf one week old, is giving 35 lbs. on 8 lbs. grain and about the same amount of hay. She gave 7,500 lbs. in eleven months last milking period.

We sell part of milk from the wagon at 10 cents; make remainder into butter for which we net 30 cents. While making butter, we cannot feed to exceed 6 lbs. of cotton seed hulls per day, and a half pound of meal. If we do, it shows very readily in the butter. Hulls are worse than cotton seed meal.

I am often surprised to see it noted by correspondents in DAIRYMAN the amount of cotton seed meal given to milch cows. When I can get my protein as cheaply from any other source, and I am not making butter, I do not feed a particle of cotton seed meal. I would not knowingly buy a cow that has been fed regularly the amount of cotton seed meal I see mentioned. It is a very constipating feed, and I consider it unwholesome for all kinds of stock. It will produce milk and lots of it, but at the expense of the animal when fed to exceed two pounds daily, especially in this warm climate of ours. The distillers grain is laxative in its nature, and so bulky and easily digested that it has everything to recommend it, if you are feeding something that needs protein to balance the ration.

As a rule, those who have feed to buy are not careful enough to find the feeding value of what they are buying. I do not know what the rules of chemists are to figure values of protein and carbohydrates but using the same unit for all, will show the comparative value, and by using the table of digestible protein and carbohydrates we can easily know if we are getting value received, when on the market to buy.

Manufacturers of by-products issue leaflets frequently, showing relative values and the article they are selling is in large black type. I enclose such an one from a Cotton Oil Co., and of course cotton seed meal stands No. 1 according to the showing they make, and cotton seed hulls stand 37th on the list of 50 kinds of feeding stuffs. Hulls differ very much in their feeding value. It all depends on the amount of seed left in them. When we are retailing all of our milk, we can feed 8 to 10 pounds per day to advantage, but not so when a part of our milk goes to butter

I limit my ration of grain for every 8 quarts of milk not to exceed 7 lbs. grain; 30 lbs. milk and over, 12 lbs. grain.

Florida. E. W. AMSDEN.

The doctrine of balanced rations, like many other theories and doctrines, may easily be carried too far, so far in fact, as to become predominant when it should be only subservient. When one is sure his animals are receiving sufficient digestible protein to supply the specific demands for that specific nutrient, he need not be concerned about the further composition of his ration, except as it may affect its cost. Protein will serve the same purposes as carbohydrates, and when it costs no more per pound of contained digestible nutrients, it may be substituted in place of carbohydrates, without regard to the nutritive ratio of the resulting combination.

A North Carolina Barn.

ED. HOARD'S DAIRYMAN:—I am about to build a dairy barn 30x60 feet with ceiling 8 feet high, for 20 cows facing outward. Should I make the building tight and use the King system of ventilation? The mercury seldom ever reaches zero here, and 20° above is considered cold. I have never seen any barn in this state, not even the barn at the Agricultural College, that had any means of ventilation except by windows. If you advise the use of King's system, please tell me how many intake and outlet flues I should have in the building.

I value your paper very highly and would not think of being without it.

Statesville, N. C. J. H. B.

If the plans already formed have not progressed too far, we unhesitatingly advise this correspondent to increase the width of the proposed barn at least four feet so as to give not less than 32 feet width, inside measurement. This is none too much for two rows of cows in any climate, and more especially, none too much for the climate of North Carolina.

As we have so often observed in regard to stable construction, similar principles apply as in constructing a dwelling house. More and more, we are coming to understand that cows need comparatively the same degree of protection from heat and cold and foul air that human beings require. The South has banked altogether too much upon climate, for statistics show, that a larger per cent of the cattle, for example in Louisiana, die from exposure to storms and cold than in Minnesota. A brief and transitory experience in the South in the early 60's convinced the editors of HOARD'S DAIRYMAN that the Southern climate is fully as trying as the Northern climate, that there are violent and pronounced changes in temperature, and that, as a rule, the dwelling houses in the South are more uncomfortable during the winter than the dwelling houses in the North.

We are, therefore, decidedly of the opinion that it would be a profitable investment for this correspondent to adopt the King system of ventilation in its entirety. He should also provide an abundance of windows, as well for letting in light as for admitting the cooling breezes of summer, if the stable is used during the warm months.

There should be about four intakes for fresh air on each side, but one large flue, two feet square will answer for drawing off the foul and cold air.

Highest Butter Records.

ED. HOARD'S DAIRYMAN:—Will you please publish in the DAIRYMAN the highest butter records for one week held by Jersey, Holstein, Guernsey and Ayrshire cows? G.

Middletown, Del.

We place so little confidence in these weekly records as determining the quality or value of a cow, that we make no effort to preserve a list of them. Experience has demonstrated over and over again that the cow making the largest amount of butter in seven days very rarely gives the highest annual yield. The large weekly records are usually made under so high a pressure that it would be almost sure death to continue it for a year. They, therefore, are in no sense an indication of the normal productive capacity.

We happen to be able to refer to the latest book of butter tests issued by the American Jersey Cattle Club and we find there the cow, Princess Second, credited with having made 46 pounds and 12 ounces of butter in seven days. This was a so-called official test made in 1885. We are not justified in saying that this cow did not make this amount of butter, but we may say, with great propriety, that the evidence submitted does not convince us, nor so far as our acquaintance extends with Jersey breeders in general, does it convince them, that any cow at any time or under any circumstances, yielded this amount of standard commercial butter in seven days.

The largest Holstein record, accepted by the Holstein-Friesian Association as officially authentic, was made a few weeks ago by the cow, Sadie Vale Concordia, owned by McAdam and von Heyne Deansboro, N. Y. Her yield as reported was 24.5 pounds of fat. At the time it was made, the rules of this Association authorized the addition of 25 per cent to the amount of fat for estimating the butter yield, and the cow was, therefore, credited with a yield of 30 lbs. 10.2 ounces of butter. Since that time the rules have been changed, so that in estimating butter from butter fat, only one-sixth is added. For records of Guernsey cows, write W. H. Caldwell, Secretary American Guernsey Cattle Club, Peterboro, New Hampshire? and for Aryshires, write C. M. Winslow, Secretary Ayrshire Association, Brandon, Vt.

A writer in a recent issue of the *Jersey Bulletin* regrets that breeders do not have any accessible means of "racing" their heifers-in-milk, or older classes, against each other in competitive butter tests for premiums or sweepstakes, just as breeders of trotting and running horses have competitive speed tests. In other words, this writer seems to lament that dairy cattle cannot be made to pander to the gambling instincts and furnish one more opportunity for winning or losing large sums of money.

We are very far from joining in this regret, and this, not for moral considerations only. The dairy cow is kept for use and the profit she may return on the farm from year to year, and it is no indication of her ability in these respects that, under forced draft, she is able to make a large daily or weekly record. On the contrary, it is the ability to keep everlastingly at it that makes her worth, just as the roadster is a more valuable horse for service than the racer.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The Quotation Committee of the Elgin Board of Trade decided on 20 cents steady as the market price of butter.

The New York market is steady at 20½ cents; receipts 17012 tubs.

The output for the Elgin district 834,600 pounds.

Hampshire offered 50 tubs and Woolverton's bid of 19 cents did not effect a sale. H. C. B.

	Tubs sold.	*Price*

DAIRY MARKETS.

ELGIN, Ill., July 6.—Butter—Ruled steady on the Board of Trade this afternoon, selling at 20c a pound, the same as last week. The sales for the Elgin district were 834,000 pounds.

CHICAGO, Ill., July 6—Butter—20 firm.

Eggs—15¼ firm.

Cattle—Prime beeves, 1,200 to 1,500 pounds, 5.25@5.40; choice to extra steers, 4.80@5.20; fair to good export and shipping steers, 4.60@4.80; medium beef steers, 4.35@4.55; plain beef steers 4.10@4.25; common to rough, 1,000 to 1,200 lbs. 3.75@4.10; good to choice feeders, 3.85@4.75; poor to plain stockers and feeders, 2.80@4.00; fair to good cows and heifers, 3.10@4.40; good cutting to fair beef cows, 2.25@3.00; common to good canning cows 1.30@2.20; bulls, poor to choice, 3.20@4.20; veal calves, good to fancy, 5.00@5.75; calves, common to fair, 3.00@4.75; corn-fed western steers, 3.85@5.25; Texas bulls and grass steers, 2.75@3.70; Texas steers, fair to common, 3.80@4.60.

Hogs—Good to prime heavy shipping 5.70@5.80; good to choice heavy packing 5.55@5.70; plain to choice heavy mixed 5.50@5.65; selected butcher weights 5.65@5.80; assorted light, 150 to 195 lbs. 5.80@6.00; thin to choice, 50 to 130 lbs. pigs 5.75@6.20; stags and rough lots, 4.00@5.50.

MILWAUKEE, Wis., July 6.—Butter—Creamery—extras, 20c; firsts, 17@18c; seconds, 15c, process (renovated) 16@17c; Dairy, fancy, 17c; lines, fresh, 14@15c; packing stock, 13c; whey, 10@12c; grease, 5@6c.

Cheese—American, full cream—New Twins, 10½@11c; Young Americas, 11@11¼c; Daisies, 11@11¼c; Longhorns, 11¼@12c; low grades, 9@10c; Brick, fancy, new, 9½@10c; low grades, 8@9c; Limburger—Fancy, old, 10@10½c; low grades, 6@8c; new, fancy, 9@10c; off grades, 7@8c; Swiss, old, drum, choice, 15¼@16c; drum, No. 2, 13@14c; Block, choice, 14@14½c; block, No. 2, 12@13c.

Eggs—Strictly fresh laid, at mark, cases returned 13¼; dirties and seconds, 12c., checks, 10c.

MONROE, Wis., June 27—Cheese—Today's quotations: New, round Swiss, 12@12¼c; new block Swiss, 11¼@12c; new brick, 9¼c; new Limburger, 8½c. 1902 cheese of all kinds sold out.

APPLETON, Wis. July 6—Cheese—Sales, 88 Cheddars and 862 Twins at 10c; 65 Twins at 10½c; 90 Twins at 10¼c.

PLYMOUTH Wis., June 30-Cheese-20 factories offered 3,604 boxes of cheese, of which 410 Daisies were passed on. The balance sold as follows: 238 Longhorns at 11⅛c, 131 at 11c; 979 Daisies at 10¾c, 758 at 10⅝c; 313 Twins at 10¼c; 526 Young Americas at 11c, 59 at 11⅛c. Market steady, active and firm.

FOND DU LAC, Wis., July 6.—Cheese—Sales of cheese at dairy board today: 140 Twins at 10½c, and 467 Daisies at 10⅝c. Market steady.

WASHINGTON, D. C. July 6—Butter—Market steady. Extras, 21@21½c. Fancy firsts 20@21c; renovated, 19c.

NEW ORLEANS, La., July 6—Butter—Market quiet;extras, 21⅛c;firsts, 19½c; ladles, 16c.

TOPEKA,Kan.,July 3—Butter—Creamery butter, 20@21c; dairy,17c.

Cheese—Longhorns,11c; Daisy 11c:Daisy Twins 10¾c; Prints, 11½c.

LIVERPOOL, July 6—Butter—Good United States steady, 75s.

Cheese—dull. American finest, white 50s, 6d; colored, 51s, 6d.

BOSTON, Mass., July 6—Butter—Creamery western extra, 21c; western firsts, 20c; dairy, 16@20c; imitation creamery, 17@18½c; ladle, 15@16½c; box and print, 16@21½c.

Cheese—Choice, 10½@11c; Wisconsin Twins, 10¼@11c.

Eggs—Nearby, 22@23c; western selected, 16c; fair to good, 14@15c; Illinois, 16c; dirties, 12@13c.

PHILADELPHIA, Pa., July 6—Butter—Steady, fair demand; extra western creamery, 21c; nearby prints 22c.

Cheese—Dull and easier; New York full creams, choice new, 10¾c; fair to good new, 10@10½c.

Eggs—Steady, good demand: fresh nearby, 17c: loss off; western, 16½@17c; southwestern, 16c; southern, 15@16c.

ST. LOUIS, July 6.—Butter—Slow; creamery, 15@21c; dairy, 15@17c.

Eggs—Lower, 13c loss off.

KANSAS CITY, July 6.—Eggs—firm; Missouri and Kansas, cases returned,11½c doz.; new No. 2 white wood cases included, 12c.

Butter—Creamery, 17@19c: dairy, fancy, 18c.

NEW YORK, July 6—Butter—Receipts, 17,012 pkgs.; market barely steady; state dairy,16½@20c; extra creamery,common to choice, 16½@20c; factory, 14@16½c; renovated, 13@17c; imitation creamery, 16@18c.

Eggs—Recipts,13,330 pkgs.; market steady; state and Penn., 15½@18¼c; western extras, 18@18½c; western, seconds to firsts, 15@17c.

Cheese—Quiet. Receipts, 9,627 packages; state full cream, fancy, small white and colored, 10¼c; large, white and colored, 10¼c.

WATERTOWN, N. Y., July 3.—Cheese—Sales, 6,000 large at 9¾@10c; small, 10@10½c.

CANTON, N. Y., July 3—Cheese — Offered 56 boxes large, 2,577 Twin and 1,473 tubs of butter. Large and sold at 9¼c; Twin 10c; butter, 20¼c.

UTICA, N. Y., July 6.—Cheese—Eastern and foreign advices have had a depressing effect on the market; 3,000 large white and colored sold at 9¾c; 2,000 small, 9¾c; 1,200 small, 10c.

NEW YORK MARKET.

NEW YORK, July 3.—Butter — Receipts for the week, 63,234 packages. Exports for the week, 418 packages.

The price for extra creamery dropped to 20½c immediately following our last report, and although receipts were very liberal and far in excess of one year ago, there has been enough trade from all quarters to keep the market steady and price on this quality is firm at the close. Special fancies sold to the grocery trade at a small premium, while speculators paid quotations for large lines of "Extras", and this was the heaviest week of the season for the storing of freezer butter.

We note sales of several full parcels of New York State and Western Creameries at 19 to 20c. There is more New York State Dairy offering; quality, however, is ordinary and the selling prices are 16@19c. Ladle butter is dull and prices favor the buyers. We quote:

Creamery, extra, 20½c: medium, 19@20c; poor, 15@18c; Dairy, extra, 19@20c; medium, 16@18c; poor, 14@15c.

Cheese—Receipts for the week, 35,311 boxes. Exports, 6,771 boxes.

Market is fairly active and steady. Sales of finest small cheese to home trade at 10⅝, and large sizes for export at 10¼c.

Some of the receivers refused to sell at these prices and put their cheese in "Freezers" for later markets. Good inquiry for best light skims, while lower grades sell slowly at irregular prices. We quote:

Full cream, small, extra, 10⅝c; medium, 10@10¼c; poor, 8@9¾c; large, extra, 10½c; medium, 10@10¼c.

Eggs—Receipts for the week, 58,828 cases. Fine fresh stock is all wanted at full prices. All other kinds are in full supply at easier prices. We quote;

New York & Penn., strictly fresh, per dozen, 19@20c: Northern & Western, best marks, 18@18½c: all Sections, poor to good, 13@17c.

177 Chambers St. DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Md., July 2—Butter—The firm feeling noted in our last issue on creamery has subsided to a large extent, and buyers have been very exacting in their demands, both as to quality and price, consequently up to the present time there have been but few sales reported of long lines: several lots that were limited in price have gone into the freezers; the local consumptive demand keeps up unusually good for the season, hence the market keeps pretty well cleaned of all desirable extras and firsts. Seconds are very slow sale, and this grade is accumulating quite rapidly. Imitation creamery—The receipts are daily on the increase; the demand is confined principally to fancy stock. Ladles—The supply is fully equal to the requirements; there is a very close discrimination in regard to quality. Packing stock continues in liberal receipt; all fresh, sweet invoices meet ready sale, while off stock is slow sale, and concessions have to be made in order to prevent accumulations. Blocks and prints continue in full supply; all stock impregnated with garlic has to be sold at reduced prices. The general market closes quiet but steady.

Creamery Separator, extras, 21½c; firsts, 20@21c;seconds, 18½@19½c. Ohio Store packed, extras,—c; firsts, 13½c; seconds, @13c. West Va. Store packed, extras,—c; firsts,13½c; seconds,13c. Creamery blocks (2-lb.) extras, 22c; firsts, 21c; seconds, 19@20c; Creamery prints (¼ lb) extras, 23c. firsts,21@22c; seconds, 19@20c. Md. Va., & Penna. Prints, extras, 21c; firsts, 20c; seconds, 18@19c.

Eggs—The conditions of the market so far this week have been rather unsatisfactory; while the receipts in general are moderate, they are about equal the requirements; the demand is confined chiefly to strictly fancy stock; this kind will always command top prices, while stock of doubtful quality is hard to move at reduced prices. Be sure to examine your eggs carefully before shipping, and ship in cases only; the market in general closes quiet at 16 cents, and lower prices are looked for.

Cheese—The receipts are fully equal to the requirements; the market rules quiet but firm.

N. Y. State—Cheddars, fine, 10¾@11c; choice, 10¼@10½c; fair, 9@9½c, Flats, fine, 11@11½c; choice, 10½@10¾c; fair, 9½@10c; Small, fine, 11⅛@11¼c; choice, 10½@11c: fair, 9½@10c; Ohio Flats, fine, 9½@10c; choice, 8¾@9c; fair, 8@8½c; O. Picnic, fine, 10@10½c; choice, 9¼@9½c; fair, 8½@9c; Swiss Cheese, (domestic) fine,15c;choice, 12½@13½c; fair, 9@11c.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale--Registered Guernsey Bull, 4 months old. W. J. DAWSON, LaCrosse, Wis.

A Good Permanent Position for the Right Man.—Qualifications: Sober, industrious, good command of the English language and knowledge of newspaper work in stock and dairy lines. Duties: Assist in editorial and office work. Address J. B., care Hoard's Dairyman, Fort Atkinson, Wis.

Wanted—Second-hand outfit for condensing milk. Address X. Y. Z., care Hoard's Dairyman. 22-2

For Sale—A second hand, self-feeding, 16 inch Smalley Ensilage Cutter in good order, together with 56 feet of carrier, 18 feet of which was new last year Also a three horse Smalley Tread Power in good condition. The above will be sold cheap to make place for larger machinery. W. D. HOARD, Fort Atkinson, Wis. 20-tf.

For Sale—First-class dairy farm of 256 acres, one-half mile from city limits of River Falls, Wis. 245 acres in crop and pasture; balance woodland. Fine buildings, creek and spring with milk-house. Call, or address the owner, MARTIN MURPHY, River Falls, Wis. 21-4

For Sale—One 6 month old Jersey bull calf, pure bred, well marked. Price on cars $30.00. Enquire W. H. RODDIS, of Roddis Veneer Company, Marshfield, Wis. 21-2

For Sale—Milk route, horses, harness, wagon, separator, cans, tickets, etc. A nearly new and very complete outfit. Present net earnings about $150.00 per month. A splendid business opportunity. Apply to JOHN L. FISHER, Hayes Block, Janesville, Wisconsin. 21-3

Will Sell gr. son Stoke Pogis and Ida of St. L. Dam tested 17 lbs. 4 oz. E. W. MOODY, No. Andover, Mass. 21-2

Two choice young Guernsey bulls for sale. MRS. A. W. LEHMANN, Neosha, Dodge Co., Wis. 12-sp

Wanted—A position as working manager of a first-class dairy or creamery. Have had 10 years experience in creamery and dairy work. Best of references. Address 309 Broadway, Macon, Mo.

For Sale—2-year-old Holstein bull; his dam is by a son of DeKol 2nd, who gave, under supervision of Cornell University, 536½ lbs. milk and 26.56 lbs. butter in 7 days, and his sire is by a son of Pauline Paul the champion butter cow of the world, 18,669 lbs milk and 1,153 lbs. butter in 1 year. Price $125. Speak quick. WIS. LIVE STOCK ASSOCIATION, Appleton, Wis. 22-sp

For Sale—Or will trade for good farm. A first-class grocery with established cash trade in best residence district in Chicago. Only best land will be considered. Will pay cash difference. EDWARD G. WIDMANN, 8 and 10 East 47th St., Chicago. 22-2

Good Dairy Farm and Route For Sale. near Gettysburg, Pa. Good chance to give family a college education at little expense. For further particulars address W. F. G., R. F. D. No. 12, Gettysburg, Pa.

For Sale—Fine litter Scotch Collie pups. Write for price. R. C. SNAVELY, Hudson, Ill.

Holstein-Friesian Bulls For Sale—Strong in the blood of the Duchess Ormsby family. Price from 20 to 35 dollars. For particulars address H. SCHAFFER & SON, R. R. No. 1, Appleton, Wis.

Macon County, Missouri. Farm For Sale.—80 acres good land, well fenced, plenty small fruits; two-story 8-room frame residence, front and rear stairs, large halls, cellar 16x32; barn 42x60 with 12x60 leanto. All in meadow and pasture. Residence within 100 yards of depot just outside corporate limits town of 600, 4 miles of coal mines two thousand miners. Place to start a creamery. Six are shipping cream 75 miles away. Price $75.00 per acre, one-third down balance 5%. Write for particulars. CHAS. H. MARMADUKE, Callao, Mo. 22-4

Wanted at Once—Experienced churn room helper in large factory. Must be active and capable of doing hard work. When writing state age and salary expected. We run Sundays. FARMERS CO-OPERATIVE DAIRY ASSOCIATION, Rusk, Wis.

Wanted—To buy a second-hand separator. Must be in good order. Prefer a Tubular. H. M. GRUBB, 1519 8th Ave., Beaver Falls, Pa. 22-tf

ONLY REGULAR AWARD, CHICAGO, 1893—GRAND PRIZE, PARIS, 1900—ONLY GOLD MEDAL, BUFFALO, 1901

A POINT

To Creamerymen Regarding Farm Separators.

A well-known and up-to-date Western creameryman, located in a territory where there is a growing demand for Farm Separators, aptly said a short time since at a gathering of fellow creamerymen:

"I have chased the agents for 'lightning-rod', second-class cream separators out of my territory by selling the patrons myself the best and only kind of a cream separator to buy—the **De Laval** machine."

Experienced creamerymen generally are doing the same thing where Farm Separators are wanted by patrons, thus holding and satisfying their patrons and protecting their business against the inroads of "centralizing" pirates and the "lightning-rod" separator cohorts associated with them.

This is a matter of vital importance to many creamerymen and one they are making a serious mistake to delay over.

The De Laval Separator Co.

Randolph & Canal Sts., CHICAGO.

1213 Filbert St., PHILADELPHIA.

217-221 Drumm St., SAN FRANCISCO.

GENERAL OFFICES: 74 Cortlandt St., NEW YORK.

121 Youville Square, MONTREAL.

75 & 77 York Street, TORONTO.

248 McDermot Avenue, WINNIPEG.

Position Wanted—A northern dairyman, graduate Wisconsin Agricultural College and of life-long experience, desires position in charge of up-to-date southern dairy. Am an expert feeder and butter maker and thoroughly understand retail milk trade and all other departments of dairy work. A No. 1 references. E. O. THORSGAARD, Valdosta, Ga. 22-2

For Sale—Two granddaughters of Exile, 20 and 21 mo's. old; served. 3 solid color St. Lambert bulls. Three 4 and 6 mo's. old, sire a double Gr. son of St. Lambert Boy sire of 54 tested cows. J. A. HERR, Lancaster, Pa. 21-4

For Sale—One 100 lb. Embree Worker; one 150 gal. Reid Box Churn; one 1000 lb. De Laval Separator; one 8 horse power engine and boiler (on wheels). Address JAMES S. BIGGS, Rocky Ridge, Md. 19-4

A Registered Guernsey Bull 15 months old for sale. A very fine animal. Inquire of J. S. HUNTER, Pickett, Wis. 12-tf

Fine Dairy Farm for Sale—Near St. Paul, Minn. 210 acres good land with ample buildings of all kinds. Page fence. cedar posts. Pure bred Holstein cattle and Yorkshire swine sell readily at good prices. Good markets for all dairy products. Will sell with or without stock and other personal property. Easy terms. Enforced removal to California only reason for selling. T. S. TOMPKINS, Pasadena, Cal. 15-tf

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

Wanted—Single man on large dairy. Only good milkers need apply. F. W. ADAMSON, Lake Bluff, Ill. 4-tf.

Wanted—Position in dairying business by single man (38) familiar with Babcock test, Buttermaking, Separators. Boilers and Engines, etc. Also the care and feeding of dairy cows. Address D-5, care of HOARD'S DAIRYMAN. 20-tf

Wanted—An up-to-date man of 20 years experience wants to rent a good sized dairy or stock farm, with stock, up-to-date buildings and equipments, tools, teams, etc., or will accept position as manager. Understand all machinery to run an up-to-date farm or dairy. Married and have family. Adr. "Van" General Delivery, Sleepy Eye, Brown Co., Minn. 20-tf

Very Low Excursion Rates to Musical Festival, American-Swedish Singers, at Minneapolis, Minn.—Via the North-Western Line. Excursion tickets will be sold at reduced rates July 20, 21 and 22, limited to return until July 27, inclusive. For particulars apply to Agents Chicago & North-Western R'y. 22-3

Excursion Rates to Ashland, Wis.—Via the North-Western Line. Tickets will be sold at reduced rates July 13, 14 and 15, limited to return until July 17, inclusive, on account of Wisconsin Elks' Annual Meeting. Apply to agents Chicago & North-Western R'y.

Excursion Rates to Monona Lake Assembly at Madison, Wis.—Via the North-Western Line. Excursion tickets will be sold at reduced rates July 21 and 22, limited to return until August 7, inclusive. Other dates of sale on certificate plan. Apply to agents Chicago & North-Western R'y. 22-3

Very Low Rates to Detroit, Mich.—Via the North-Western Line. Excursion tickets will be sold July 14 and 15, with very favorable return limits, on account of I. E. L. Convention. Apply to agents Chicago & North-Western R'y.

"Short Jaunts for Busy People" is the title of a handsomely illustrated booklet issued by the Chicago & North-Western R'y, briefly describing nearby summer resorts, with information as to summer hotels and boarding houses, railroad and hotel rates, etc. Sent on receipt of 2 cent stamp. Address W. B. Kniskern, Passenger Traffic Manager, Chicago. For rates, tickets, etc., apply to agents Chicago & North-Western R'y. 18-sp

Special Excursion Rates to Colorado, Utah and the Black Hills—Via the North-Western Line. Beginning June 1st excursion tickets will be sold to Denver, Colorado Springs, Pueblo, Salt Lake City, Hot Springs, Deadwood, Lead and Custer, S. D., etc., good to return until Oct. 31. A splendid opportunity is offered for an enjoyable vacation trip. Several fine trains via the North-Western Line daily. Apply to agents Chicago & North-Western R'y. 16-sp

Special Excursion Rates—The North-Western Line will sell low rate round-trip tickets to Fond du Lac and intermediate stations, good every Sunday until Sept. 27, 1903. Apply to agents Chicago & North-Western R'y. 21-7

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

Very Low Rates to California and Return—Via the North-Western Line. First-class round-trip tickets on sale July 1 to 10, inclusive, to San Francisco and Los Angeles. Favorable limits and stop over privileges and choice of routes. The overland limited, most luxurious train in the world, leaves Chicago daily at 8 p. m. Less than three days en route. Drawing room and compartment cars, observation cars, dining cars, buffett-library cars (barber and bath), electric lighted throughout. Three trains a day from Chicago to the Coast through without change. Daily and personally conducted tourist car excursions to California, Washington and Oregon. For particulars apply to ticket agents Chicago & North-Western R'y. 16-7

Fourth of July Excursion Rates—Via the North-Western Line. Excursion tickets will be sold at low rates to points on the North-Western system within 200 miles of selling station, July 3 and 4, good returning until July 6, inclusive. Apply to agents Chicago & North-Western R'y. 20-3

Very Low Rates to Denver, Colorado Springs, Pueblo and Return—Via the North-Western Line, July 1 to 10, inclusive, with final return limit until and including August 31, 1903, account of C. E. Convention. Stop over privileges and choice of routes. Side trips can be made at reduced excursion rates to various Colorado points, to the summit of Pike's Peak, to Ogden and Salt Lake City, (to Yellowstone National Park, from Denver, only) and to San Francisco, Los Angeles, etc. Low rate excursion tickets to Colorado also on sale daily, limited for return until Oct. 31. For particulars apply to ticket agents Chicago & North-Western R'y. 20-3

Observations after an Eastern Trip.

Clarifying and City Milk Supply.

ED. HOARD'S DAIRYMAN:—Upon my return here I found some inquiries by mail, called forth by my remarks in HOARD'S DAIRYMAN of June 5, page 400 and 401, regarding clarifying and pasteurizing. Having had several verbal inquiries on the same subject, it may be as well to reply in HOARD'S DAIRYMAN if room can be found. On my late trip I had several confirmations of my views on that subject.

"Shall I clarify?" "Shall I pasteurize?" are questions frequently asked both by milk dealers and milk producers, and I always answer: "That depends." At the Ohio State Dairymen's Convention the question was asked: "What was the difference between a horse and a hobby?" Answer: "A horse you can get off of, a hobby you can't." This was a special hint for my benefit, applied to pasteurization, and I appreciated it rather as a compliment, because I think it as fine a hobby as I ever rode in my boyhood days. But for all that, I can get off for a little while on special occasions. And I shall, therefore, first say a word about when I think clarifying by separator should be done and when not.

WHEN IS CLARIFYING NOT NEEDED?

Of course I speak especially regarding milk for city supply. Now, when a dairyman can give such careful attention to details in producing milk at his own private dairy, that such milk comes up to the high standard of purity required by the various "Milk Commissions" to be labelled "Certified," then such milk should be so free from impurities, that when left undisturbed in a bottle for twelve hours, no sediment whatever will be found at the bottom.

Every ambitious dairyman should frequently make this simple test for his own satisfaction. If any sediment is found, then he better mend his ways, or clarify. I have frequently examined bottles sold with certified milk which did contain sediment, and while all such dark accumulations in the milk are not necessarily poisonous, still they prove a lack of such especial care as is implied by the word "certified," which then becomes a delusion and a snare. I was pleased to see that Mr. H. B. Gurler, who certainly has carefully investigated as to what would be injurious to milk used for infant feeding, is very positive that no injury can be done to the character of milk by running it through a separator, even when not necessary for purifying purposes, but merely in order to have an exact fat per cent in the milk, and if we cannot have clean milk in any other way, I think all such doubtful milk rather should be run through a separator to remove all visible impurities, which always are liable to injure the milk in some way if permitted to remain in it Every dairyman producing milk for direct consumption, can soon find out how clean his milk is.

To decide whether a "Pure Milk Co." should "clarify" all milk collected from a number of dairies or not, I suggest this rule: Better to keep dirt from getting into the milk, than taking it out afterwards! Now, if such a Milk Co., depends on its supply from a limited number of dairies and said dairies belong to a rather cleanly class of farmers within such limited distance from the milk plant in town that they as a rule haul the milk themselves, then I advise that said company, before starting operations, make an effort to induce all these patrons to milk their cows in such a way as to furnish milk as free from dirt as possible, and besides paying for all milk according to fat percentage, also to give special premiums to such patrons who for the whole month have supplied the cleanest and coldest milk, and "dock" those whose milk has not been up to the standard for cleanliness and cooling.

In that way we may succeed in a few places, to get milk so clean that clarifying becomes unnecessary. While such ideal, general supplies for a city or town will be exceedingly rare, still no efforts in that direction will ever be wasted, and will necessarily bear fruit by a gradual improvement of the whole milk supply. Now I shall mount my "hobby" again.

WHEN IS PASTEURIZING NOT NEEDED?

When a dairyman not only gives his personal attention to the most cleanly methods in milking and handling of the milk, but also has such ideal sanitary conditions of stables, cows and employees, as to make it possible and practical to produce an ideal, pure milk, every day in the year, and also to make sure that the milk is handled and delivered in such careful manner as to reach the consumer in perfect condition. We should add, that even such ideal milk is too frequently deprived of its excellence by careless handling and exposure by the customers themselves.

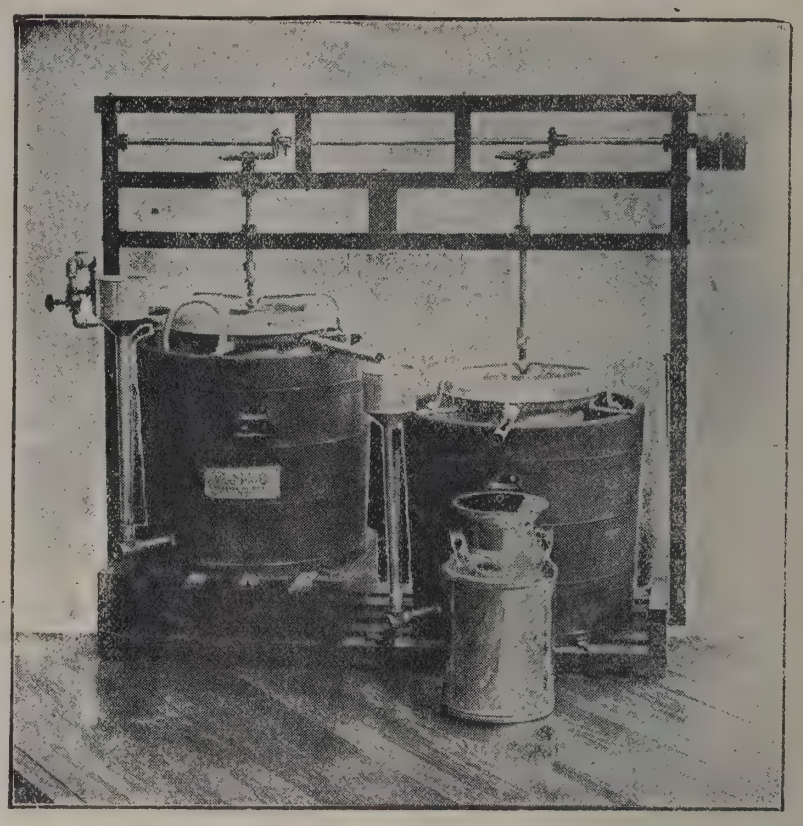
During my eastern trip I had full confirmation of my views, that such milk is, and will continue to be, very scarce. There is very little increase in the supply of such truly "certified" milk, because the much increased cost of production makes the sale price so high that very few people are willing to pay it, even though they are able.

The great mass of people who rear the most children, and who especially need a better milk supply, will never get this ideal "certified" milk, and if they shall have a uniformly wholesome milk, such must be supplied by an entirely different method.

WHEN IS PASTEURIZATION NEEDED?

From all my observations in towns or cities in the East and Middle West, I have come to the conclusion that the places are very scarce indeed where proper pasteurization would not effect a most beneficial improvement in general supply of both milk and cream for cities and towns. It is an undeniable fact, that in every city, where pasteurization is being more generally introduced, a constant and gradual improvement of both milk and cream is taking place.

The best confirmation of this assertion may be found in the circumstance that no dealer, who once has properly adopted pasteurization of his supply, goes back to the old way! And those who at first only pasteurize the supply from one source, gradually adopt it for all. It may be asked if pasteurization is of such advantage, why then do not dealers more rapidly adopt it? The reason is simple enough: A great majority of dealers do not have such control of their supplies as to compel pasteurization at the shipping depots, neither are their present facilities in the cities such as to make a change in their whole system easy.



Before they can realize benefits and profit from such a change, a considerable expense is necessary; those who have ample means are reluctant to make the change, until they are fully convinced of the financial advantages to be gained; others, who would like to make the change, lack the means to do it properly, and have to wait, or combine with others. But this comparative slowness in a general adoption of pasteurization, I think will in the end prove most beneficial to the consuming public, and to the milk producers as well.

If every one who just took a notion, could at once try pasteurization for a while, too many would go into it carelessly and without sufficient knowledge of all the details necessary for successful, proper pasteurization. Dealers have by this time found out that the old makeshift methods of so-called pasteurization will not answer, and such have almost disappeared. If we want an improvement, we want it right. The public always takes slowly and suspiciously (can we blame them?) to every new "fad", or what they suppose to be such, and it is no wonder that so much prejudice exists both among the general consumers and physicians, against so-called pasteurized milk.

PHYSICIAN'S OPINION REGARDING PASTEURIZATION.

We hear a lot of talk about physicians being opposed to pasteurization, especially by milk dealers who are not ready to adopt it, and by a few narrow minded private dairymen, who fear that a general adoption of pasteurization of milk for city supply would lessen the demand for an ideal raw milk, for which they even now find it difficult to find a steady market at the higher prices made necessary by its expensive production. With all my enthusiasm regarding pasteurized milk I am still convinced that there will always be a good market for truly "certified" milk; while on the other hand

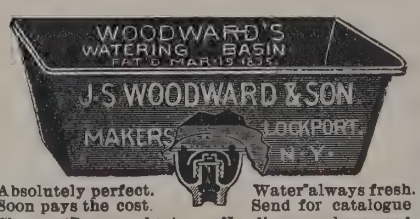
A GREAT SUCCESS.

The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

THE MILLER PASTEURIZING MACHINE CO.
CANTON, OHIO

SAVES ITS COST
ON THE FIRST CROP.



It spreads all kinds of manure, lime, salt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.

Do you know of any other piece of machinery for use on the farm of which this can be truly said?

The Improved
Kemp Manure Spreader

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new **Beater-Freeing Device, Apron-Returning Device** and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about **"How to Grow Big Crops."** Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court. KEMP & BURPEE MFG. CO., BOX 46, SYRACUSE, N. Y.

Absolutely perfect. Soon pays the cost. Cheapest, because best. Water always fresh. Send for catalogue No disease where used.

Water In The Stable a Necessity.

It is universally acknowledged that stock in the stable should have constant access to water of suitable temperature, and all progressive Dairymen are putting in some form of Watering Device. Why not use the Best? Write for descriptive circular.

RIFE ENGINE CO., 120 Liberty St. New York.

most certainly a genuine improvement of the general milk supply by pasteurization will gradually do away with all "sham" sanitary and certified products.

On my late trip I called again upon a number of the best known physicians connected with health boards and milk commissions in Washington, Philadelphia and New York and found none of them opposed to pasteurization provided only good, clean milk is used for such purposes. They also all agreed, that whatever method of pasteurization destroys disease germs and lactic acid germs, without changing the natural character of the milk, is the most desirable method; all also emphasized the importance of a method, by which all milk was treated absolutely uniformly, so that both physicians and consumers would feel assured that milk and cream received one day would be just as pure and safe every day in the year. This lack of uniformity in the product, so commonly caused by older (and some late) processes, is today the one hindrance to the introduction of pasteurization.

We constantly hear it repeated that physicians do not believe in pasteurizing milk for infants. Now if there were any real foundation for this opinion, then certainly we should not have heard so much again right lately, regarding the saving of so many little lives by the distribution of pasteurized milk from the many various charitable milk depots; nor would Nathan Straus' gifts of outfits of nursing bottles, etc, for pasteurized modified milk, have been accepted with such great gratitude by the charitable milk commissions for Philadelphia and Chicago.

If pasteurized milk is good for the babies, it must be good for all, and while few take as good care of their stables, cows and milk as the Walker-Gordon Co., still about half the milk prescribed for infants by physicians is today ordered pasteurized to a temperature of 160° or 170° for 30 minutes, about the same as used in Mr. Straus' laboratories—which prolonged heating of course causes far more change in the character of the milk, than when such is rapidly heated to only 160° or 162°, and rapidly cooled below 40°, the whole process only requiring 1½ minutes. Whenever I have explained this matter to physicians, they invariably become much interested, and desirous of an early opportunity to personally observe the work done in this manner. I can also assert that a number who have acquainted themselves with the modern process, have been most agreeably surprised and have a very different opinion regarding pasteurizing from what they had before.

TO PRODUCERS OF CERTIFIED MILK

who look upon pasteurization as their enemy, I wish to say, that I know at least 3 of the most careful producers of such milk, who endorse and recommend the best modern method for continuous and rapid pasteurization and cooling. Mark it, these are all men who don't believe in sham work of any kind, who know there is always room at the top, and who never oppose anything that will help to improve the general supply of milk. They are Mr. R. A. Pearson, General Manager of the Walker-Gordon Co., in New York City; Dr. Geo. B. Chapman, who personally superintends the production of certified milk at his dairy farm at Dover Plains, N. Y.; and H. B. Gurler, who produces certified milk for Chicago at his private farm, but who also, as Pres. of the DeKalb Dairy Co., pasteurizes all milk collected from the various farms supplying milk to said company. This is what I like to "rub in," that there should be no antagonism between certified and pasteurized milk, but that on the contrary they fill two distinct needs, and should be sold side by side by the same suppliers and from the same wagons. The saving of wasteful expense in the delivery of certified milk by itself is obvious.

EXPENSES OF PASTEURIZATION.

The variety of opinions regarding cost of pasteurization is easily explained. The largest and best known firms invariably say that any extra expense incurred is far outweighed by the saving from losses of souring surplus. Once in a while we hear some late beginner say that it costs too much for ice. Why is this? Simply because the first necessity for economizing ice, or artificial cooling, is an ample supply of cold water. If we depend on water from a creek or pond, it will be cold only as long as the weather is cold, but when summer arrives such water gets too warm.

Whoever wants to pasteurize most economically, should try to supply sufficient water from a well or spring. The colder and more abundant the more saving in the ice bill. In a city where a refrigerator plant is operated in connection with the milk plant, this economy is less important than where we depend on ice for cooling. Still even in cities I advise the boring or driving of a well, which always will pay.

In no case do I advocate "clarifying" milk (collected from several dairies) for cleaning purposes, without subsequent pasteurization. Any milk containing impurities and sediment to be removed by any method of "clarifying," unavoidably also contains an excess of a variety of germs, which need destroying by pasteurization. While "clarifying" frees milk from visible particles of dirt of all kinds, still experiments frequently have shown that the keeping quality was lessened instead of increased.

I close by asking any readers to write regarding any point where I have not been sufficiently clear, and I shall reply as far as I am able in HOARD'S DAIRYMAN.

J. MOLDENHAWER.

Canton, Ohio.

Notes from the St. Louis Exposition.

F. D. Coburn, Chief of the Department of Live Stock, of the Louisiana Purchase Exposition, has arranged for a total of over 26,000 prizes in the classifications for horses, cattle, sheep, swine, poultry, etc., for the World's Fair show next year. These are unprecedented in amount and are divided among twelve breeds of beef and dual-purpose cattle with 2,352 prizes; four breeds of dairy cattle, 560 prizes; nineteen breeds of horses, 3,458 prizes; eleven breeds of swine, 2,772 prizes; fourteen breeds of sheep, 2,548 prizes; 375 varieties of poultry and pigeons, 10,300 prizes; fifty-seven breeds of dogs, 2,604 prizes. There are thirty-two additional prizes for single cows and herds entered in the dairy demonstration; five for oxen; fifty-five for mules and 1,310 for the estimated displays of pet stock, vehicles, etc.

Provision has been made for five cash prizes and two honorable mention awards in most sections except poultry. The final arrangements of the classifications may still further enlarge the number of prizes offered.

Up to the present time that feature of the World's Fair at St. Louis pertaining to live stock has been designated as a "section," a title which erroneously seemed to indicate that it was a branch or subordinate feature of some other department.

This has now been changed by the management and Mr. Coburn will hereafter be officially known as "the Chief of the Department of Live Stock." The Exposition has added much to its popularity in making live stock an independent department and giving it a separate Chief with a prize fund of $250,000. This substantial recognition will do much to attract attention to the great St. Louis enterprise and secure the hearty co-operation of stockmen, fanciers and others interested. This is the first World's Fair to give live stock the prestige and rank of a department with an independent Chief, and the great extent and high character of the live stock exhibits already assured the World's Fair, confirm the wisdom of this liberal policy.

An entirely new departure decided upon as a leading feature of the live stock awards at the Louisiana Purchase Exposition, is the premier or sweepstakes championships for each breed. These are intended as grand prizes to recognize both the skill of the breeder and the enterprise of the exhibitor. It is proposed to give a premier championship award to the breeder making the best showing in each class, the showing to be determined by the largest aggregate amount awarded to animals bred by the breeders represented in that class. The premier award to the exhibitor in each class will be made on the same basis.

The large amount to be offered for prizes and the consequent breadth of the classifications and the world-wide character of the shows will make the premier championships at St. Louis an exceptional honor, certain to be strongly competed for and highly appreciated by the exhibitors as well as breeders of the prize animals.

Live stock exhibitors in each breed class at the World's Fair will receive a senior champion prize and a junior champion prize for males and females, and a

reserve champion award will follow in the four classes. Competition for the senior championship will be limited to mature animals, and young males and females only will compete for the junior champion prizes. Prospective exhibitors express themselves as highly pleased with the plan of Chief Coburn of providing for a more equitable method of awarding championship prizes, and thus increasing the number of honors.

French Butter Making.

Too Much Air in Cream Detrimental Says Professor Leze.

For many years there has been a claim, with but little foundation, that the action of oxygen was necessary for the production of the finest butter, and the patent office shows numerous devices for the oxygenation of cream, which have never been used beyond the experimental stage. Now the expert says that oxygen is injurious and gives his reason in the following article on butter production and cream ripening:

At a recent meeting of the British Dairy Farmers' Association held while visiting France, Prof. Leze read the following paper reported in the *North British Agriculturist*:

The manufacture of butter has for a long period been a prosperous industry in France, and the produce of Normandy in particular has enjoyed a world-wide reputation for its quality and delicious aroma. On the farms of Normandy are found those admirable pastures, full of sweet herbage, which produce the suave and delicate perfume. The aspect of these fine pastures, and their very luxuriant vegetation, are suggestive of the prosperity of the large breeders of cattle and of the facility with which their breeds succeed under these happy conditions. The dairy in Normandy is the most natural of those industries which are attached to the farm, and it is most agreeable to see on many large holdings of the country how admirably the milk apartments are equipped, and the perfect condition in which they are maintained. It is the delight of the mistress to show her department to her visitors, and she is happy to receive the legitimate compliments which are addressed to her. It is easy to recognize that, with the care which is generally exercised in Normandy throughout the whole of the work, and with the method which is regularly followed, the farmers are able to manufacture produce which is at once excellent and uniform in its superior character, accidents being quite the exception, and the exception extremely rare. If care in manufacture is diminished, or cleanliness less scrupulously observed, difficulties are multiplied, and on particular days the butter is inferior and will not keep. In this case, however, it is set aside, and when the trouble has disappeared the thought of it is diverted, and the accident is quickly forgotten.

It is necessary to remember that in this industry a study of the question leads us to a special difficulty—that which relates to the rapidity of manufacture. The milk arrives at the farm; in twenty-four hours, at the outside, it has disappeared—often, indeed, in still shorter time. If intended for the production of butter, it is skimmed on its arrival, the cream is put to ripen or to sour, and subsequently churned, the butter produced being despatched as rapidly as possible to the consumer. What can be done in so short a time? Under the circumstance the practice is too long, but the farmer takes the risk, and it is for him to decide. If the butter is good, so much the better; if it is bad, so much the worse. Nobody knows why, and it is believed to be impossible to know.

Happily, in the dairy experiment stations, it is precisely this scientific question which is the object of research and investigation. The attention of those engaged in the work is called to two points—the quality of the milk, and the fermentation or ripening of the cream.

Of the quality of the milk we have little to say; it is evident that if the milk is bad, it is impossible to manufacture anything good. The good dairywoman takes care of the quality of the milk; she tastes the cream, she determines the necessary acidity she requires, and she rejects mercilessly the doubtful milks, of which the odor and flavor are not those of milk fresh and pure. It is however, to the souring, or maturation, of the cream that attention should be called; it is necessary to point out, and even to persuade those concerned, that it is in the course of this process that the quality of the butter is created—good, if the maturation is well conducted; bad, if it is defective. This maturation is accompanied by an augmentation of acidity, and we may lay down the principle that if the acidity is not rapidly and regularly augmented the butter will be defective. It is not necessary to have recourse to an elevation of the temperature in order to develop this acidity. At 20° C (68° F.) or even 18° C. (64° F.) it is too warm, and fermentation is defecttve. It is necessary to endeavor to maintain the cream at from 14 to 15° C. (56 to 59° F.) The fermentation is, say some, a lactic fermentation. This is true as a point of departure, and it may be found advantageous to employ the lactic ferments of commerce in order to freely promote acidification. Reliable ferments are rare, and it is important to select from the best brands with great care, inasmuch as commerce has often been encumbered with goods of deplorable quality. This, however, we would specially insist upon, that the maturation to which we have referred is a fermentation without air; it is, in a word, a fermentation anaerobic. Air is detrimental to the quality of cream. If cream is produced by the mechanical separator, it is necessary to carefully purge it of air, for it is too much aerated. To this end a thin layer of cream may be spread over two refrigerators, which will bring it down to a temperature of 4 to 5° C. (39 to 41° F.). If, however, a vacuum could be produced in the vessels which contain the cream, this would be perfect. Without this operation, which is often difficult, it is necessary to keep the cream at a low and regular temperature.

It is easy to prove that air is detrimental; for the superior or first layers—those exposed to the air—have always a disagreeable flavor, and they are rejected in consequence. Finally, we may point out that the most apparent and genuine superiority of cream raised spontaneously, over cream mechanically separated, is specially found in this absolute want of mixture with air when the cream rises by gravitation. It is also interesting to show that if we add to cream certain ferments free from oxygen, the quality is much improved. We insist upon these new ideas as of the highest practical importance, and we propose to develop, for those who are more particularly interested, the scientific side of these reactions of ferments.

Least Practicable Diameter for Stave Silos.

ED. HOARD'S DAIRYMAN:—Last year I saw in the *American Agriculturist*, a description of a stave silo; it was built of 2x4 scantling. They said to build a foundation of stone and set up the 2x4's like staves and spike every one to the other, just as they are set up (the idea being to keep the staves from falling down in the summer time or when it is empty) and put iron hoops on so it can be tightened up by drawing the hoops up

Fairbank Guernsey Herd
Mr. Fred Rietbrock and Geo. C. Hill & Son wish to announce to the readers of the Dairyman that they have jointly purchased this justly celebrated herd.
From this herd have come such well known cows as Materna, that was the best Guernsey in the World's Fair tests in 1893.
Lily Ella and Lilvta, with official records of 782.2 and 710.5 lbs. fat respectfully.
Lady Enid and Grayline, winners of 2nd and 3rd prizes at Wisconsin State Fair, 1902, and many other well known cows.
There are now in the herd many as good cows as were ever there, including the following record daughters of Lily's Bonny Boy.
Starlight of Geneva, 542.37 lbs. fat; Careno 2nd, 468 lbs. fat; Teresita 436.2 lbs. fat; Oido of Geneva, 356.6 lbs. fat, and Electra of Geneva 363.27 lbs. fat.
Besides these are many other high record cows mostly granddaughters of Lily's Bonny Boy. We offer many of the best for sale including the two herd bulls, Wolfram, 5 years old from Materna, and Starlight's Excelsior, 17 months old, out of Starlight of Geneva.
These cattle can be seen at farm of Geo. C. Hill & Son, Rosendale, Wis., after July 15. Address all correspondence to CHARLES L. HILL, Rosendale, Wis.

A BUTTER PROBLEM

THE AVERAGE COW.		A WINTERGREEN HILL COW.	
130 lbs. butter per annum at 18c	$23.40	739 9.10 lbs. butter, per annum at 25c	$184 97
Skim-milk	11.74	Skim-milk	21 94
Total	$35.14	Total	$206 91
Deduct the usual allowance for keeping	35.00	Her keeping for the year cost	54.75
Profit	.14	Profit	$152.16

The above comparative statement shows what may be accomplished by a cow bred and trained for a special purpose. It is within the power of any farmer to increase his results at a very moderate outlay by introducing better blood into his herd through a well bred sire. A treatise has been prepared giving hints believed to be of value to any one wishing to investigate the subject. It will be sent, free, with bull sale list, to any one contemplating a purchase. The list includes bulls of all ages, of good breeding, and offered at reasonable prices. Address
WINTERGREEN HILL FARM, Dept. A., Scottsville, N. Y.

The Evergreen Farm Herd has for sale three or four A. J. C. C. heifers bred Also a few cows and some choice bull calves from two to six months old. Write for pedigrees and prices.
N. N. PALMER & SON, Brodhead, Wis

with a wrench; 4x4's being set up equal distance in the circle with holes in to hold the hoops to place, with earth bottom, claiming it kept the silage better on the ground than a cement bottom.

I have never seen a silo and don't know anything about them, I would like to know through your paper, when to put the corn in the silo and whether there should be any water put on it as it is put in. Also, why would it not be a good idea to put clover in a silo, as it is so hard to cure, about the time of the year when it rains pretty easy and often. I want to know what you think of a silo built of 2x4's, with iron hoops and earth bottom, as I want one as cheap as I can get it, so it keeps the silage in good condition. Would it be practicable to build one less than 15 feet in diameter.

Fenelton, Pa. C. J. MILLER.

The plan proposed for building a silo will answer all practical purposes, but we should prefer a cemented bottom unless the soil is a pretty hard, impervious clay. A porous soil will let in more or less air and this will tend to spoil the silage.

Our personal experience this season, in trying to secure a heavy growth of alfalfa and common red clover, adds very much to our conviction that it is a good idea to put the first cutting into the silo rather than attempt to cure it for hay.

Corn is at its best for silage when the lower leaves on the stalks commence to dry and the grain on the ears is fairly well glazed or dented. At this stage, it is not necessary to put any water on the corn as it goes into the silo, but when the silo is filled, it is a most excellent plan to put on a large amount of water, thoroughly wetting the surface all over. In fact, our best success in keeping silage was in a silo without any roof, where the frequent fall rains kept the top pretty thoroughly wetted. There was very little loss on the surface and practically none further down.

Building an Ice House.

ED. HOARD'S DAIRYMAN:—We wish to build an ice house. Having had no experience, we submit you our plan and would be pleased to have your opinion through the DAIRYMAN as early as convenient. Our plan is to build a stone wall 16 inches thick, 16 feet square, 12 feet high, laid up in good lime and sand and build a frame building outside of the wall with a six-inch space between the wall and siding; building would be well drained, standing on a solid ledge of rock about two feet in the ground.

Angola, Kan. C. K. R.

The plan proposed is a very good one in many respects, but in our judgment, would be considerably improved by reversing the locations of the stone wall and the wood covering. In other words, we would build the stone wall and then line it with boards, leaving an air space of some four to six inches. Double board the inside with a good quality of tar paper between so as to make it effectively air proof.

Just what is meant by good drainage, we cannot quite determine. As will be seen in the answer to a correspondent in New York, it is necessary in providing this drainage to effectively exclude all possibility of the entrance of outside air. If a pipe drain is laid, it must be securely trapped.

70 HEAD PUBLIC SALE 70 HEAD

GREATEST OFFERING OF

HOLSTEIN-FRIESIAN CATTLE.

McADAM & VON HEYNE'S

Justly Celebrated Herd of Holstein-Friesian Cattle will be sold at Public Auction, at Brothertown Stock Farms, Deansboro, N. Y., on

WEDNESDAY, JULY 15, 10 O'CLOCK A. M.

SADIE VALE CONCORDIA, THE WORLD'S CHAMPION BUTTER COW, with an official butter test of 30 lbs. 10 2 oz. of butter in seven days, 123 lbs. 10.7 oz. in 30 days, and 220 lbs. 8.4 oz. of butter in 60 days, will go to the highest bidder. Also one of her sons, two daughters, five grand-daughters, two great grand-daughters and two great grand-sons are included in this sale, and placed within the reach of every buyer or breeder.

This sale also includes the famous ex-champion, Mercedes Julip's Pietertje, with an official record of 29 lbs. 5.7 oz. of butter in seven days, her daughter and her grand-daughter.

This Sale Offers to Breeders Three Sires of Very Choicest Breeding

SADIE VALE CONCORDIA'S PAUL DE KOL, No. 27,392, three years old; sire Paul De Kol 4th.; dam, Sadie Vale Concordia, official record 30 lbs. 10.2 oz. butter. This is the world's record for mature cows.

SIR PIETERTJE POSCH, No. 30.155, two years old; dam, Alta Posch, official record 27 lbs. 2.4 oz. butter, at 2 years and 11 months. This is the world's record for two and three year old cows.

CANARY MERCEDES JOHANNA DE KOL, No. 30,251; sire Johanna Rue 2nds. Paul De Kol; dam, Canary Mercedes Brightest, official record 21 lbs. 3 oz. at 2 years and 11 months. His four nearest dams average 23 lbs. 5.6 oz. butter in official record; they also average 4.06 per cent. in butter fat. All cows offered are in calf either to one or the other of the above named bulls. The Herd numbers

70 HEAD OF VERY SUPERIOR ANIMALS,

selected with great care. A large number being from the CELEBRATED YEOMANS HERD. This superiority has been strongly demonstrated, having won in last year's official tests more prizes for large and economical production than any other herd either in the United States or Canada.

In this offering of fine stock are cattle suitable for the best herds, also for the improvement of good herds, as well as cattle for the beginner; as the latter, in buying any of these cattle will start with the most famous and most desirable families, the most important, if not the prime factor in the success of breeding pure bred cattle.

The farms can be reached on the D. L. & W. R. R. to Waterville, N. Y., or the O. & W. R. R. to Deansboro, N. Y., where at either station visitors will be met promptly, on the morning of the sale, and conveyed to the farms. Also the farms can be reached by trolley from Utica to Clinton, N. Y., thence by livery. Catalogues ready early in June. Address

Mc ADAM & VON HEYNE, Deansboro, N. Y.

The sale will commence promptly AT 10 A. M. WEDNESDAY, JULY 15, 1903.

COL. CAREY M. JONES, Auctioneer.

LOOK HERE.

34 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Gem Pietertje Hengerveld Paul DeKol, or Sir Ormsby DeKol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days, average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd? McGEOCH HERD is located at Lake Mills, Wis., 56 miles west of Milwaukee. For particulars address H. B. Daggett, Mgr., Station A, Milwaukee, Wis Residence: National Ave. near 40th. Phone, South 1691

Raising a Calf and Caring for the Dam at Calving Time.

(An Address before the Jersey Breeders' Association of South California, by PROF. E. W. MAJORS.

The first thing to decide, if the animal is not a heifer with first calf, is, how long shall we have the cow go dry? I believe that six or eight weeks is desirable, except in the few cases where forced drying up would cause injury to the udder. There are some cows that want to go from one period of lactation to the next without going dry at all, and they are heavy milkers, and injury to the udder may result from the attempt of compelling them to go dry. However, if judgment is used in reducing the feed about two months before the time of calving, nearly every cow may be made to go dry without injury.

The feeding of the animal during the intervening six weeks is an important factor in preparing her for good work during the approaching lactation. I do not altogether believe in the semi-starvation method that is so frequently advocated. The cow has to nourish the foetus and store up some reserve food to carry her through the calving period. Prof. Haecker of the Minnesota Station has shown that cows lose weight for about nine weeks from the time of calving. He has shown also that the per cent of butter fat decreases gradually during that period. It is these facts that enable our friends, the Holstein breeders, to make large seven-day tests, the cows giving large amounts of milk and testing much higher during that period than they will during any other time in the period of lactation. The risk of milk fever must be considered, but attention to the condition of the animal's bowels will enable us to ward of this dreaded disease without letting her get into too run-down a condition. The food should not be too heating. Bran and oil meal, with some succulent feed, as grass or roots, will be satisfactory. Where green alfalfa can be fed you have a supply of the most valuable nutrients, especially if some straw is used in addition.

As the time of calving approaches, consideration must be given to the place where the animal is to be when calving. A clean, well lighted box stall is the most desirable. The animal should be put in there some days before, in order to have her become accustomed to her surroundings. This, too, gives the herdsman a chance to notice the condition of the droppings and find out whether the bowels need loosening. If they do, a dose of salts should be given. Use about 1 pound Glaubers salts and 1 ounce of ginger. If a heifer with first calf, her udder should be rubbed and the teats worked gently so as to have her accustomed to the idea of being milked. Much trouble with kicking cows might have been prevented had the owner devoted a few minutes now and then, to the handling of the heifer. In fact, I do not think that this ought to be left to the last four or five weeks, but should be begun early in the life of the calf. Exercise should not be neglected, and it is much better for a cow to be running out of doors in the bright sunshine, than to be shut up in a close stall. Fresh air and exercise are powerful aids to a healthy condition.

As the day of calving approaches see that the stall is bedded with good clean straw. Let no droppings or urine-soaked straw remain there longer than necessary. It is very desirable, too, that the hind quarters of the cow, including the vulva, be kept as clean as possible. When calving takes place the herdsman, or better, the owner, should be near at hand without being too much in evidence. Many herdsmen seem to consider this a time when their services can be dispensed with altogether; others are anxious to assist in the operation whether they are needed or not. There is a happy medium. He should see that the presentation is normal, otherwise the cow may strain until she is exhausted, and may die; or she may do some lasting injury to the tender organs. As soon as the calf is dropped, the cow will, as a rule, lick it dry. If she refuses to do this, the calf should be sprinkled with salt and this generally has the desired effect. Should the cow still refuse, the calf must be rubbed with a woolen cloth. However, we have seldom to resort to the last method. At this time there is another point that should, I think, receive more consideration than it does. We are troubled a great deal with white scours. Veterinarians who have made a study of this disease tell us that infection frequently occurs through the navel. The cord is, of course, broken at the time of birth, and while it is closing over, germs may enter directly into the animal's body. Many doctors have recommended the tying and cutting of the umbilical cord and while I do not fully agree with this, yet I think it would pay to use a disinfecting wash and some drying powder. The following has strong endorsement for the wash: a five per cent carbolic acid solution; and for the powder, tannicacid, 1 ounce; iodoform, 4 drams; zinc oxide, 1 ounce. Use the wash first and then cover the navel with the powder. While both mother and the calf must receive our attention, it will be somewhat less confusing if I continue the treatment of the dam and take up the calf later.

The cow will, if she was in a good healthy condition, generally clean—that is, pass the afterbirth—soon after calving. If she does not, I would not be in a hurry to remove it. A weight may be tied to the part protruding from the vulva and the constant bearing down will aid in bringing it away. If it does not come away within forty-eight hours I advise the consultation of a veterinarian, unless you are thoroughly familiar with the internal anatomy of the uterus. Damage may be done to the generative organs and the animal made a non-breeder by the misdeeds of an ignorant operator.

The cow should be given water, but it should not be too cold. A large amount of cold water may cause an animal's not cleaning as rapidly as it otherwise would. A good way to supply the water is through succulent feed, as by grass or roots, and by slopping the grain. A slop of bran and flaxseed meal is cooling, and, at the same time, has a laxative effect. Be sure that the bowels are working freely. If there is the slighest tendency to constipation give some gentle laxative. Salts are probably the handiest and are quite effective.

Feeding should be done judiciously. To crowd the animal with food during the first week is most undesirable. Get her off her feed during the early period and you will have more or less trouble during the whole period of lactation; commence slowly and increase gradually as you see she responds through the milk pail. Better to have her a little hungry than to have her appetite clogged.

Let us return to the calf. I do not advise allowing it to suck more than once. In fact, I am not sure but that it is better to remove the young animal before it has been allowed to suck at all. The pen to which it is removed should be some distance from the dam's stall, as, if they cannot hear one another call, you will have less difficulty in getting them accustomed to the separation. The quarters should be well lighted and ventilated and in such a position that the sun may shine in as freely as possible. There are no better preventives of disease than fresh air and sunlight. The calf must be given the first milk taken from the cow, the colostrum, as that is necessary for properly clearing the bowels and starting the digestive functions. In teaching a calf to drink, we find that they have different degrees of intelligence. One learns quickly, while another seems to prefer starvation rather than learn to drink. Pure bred animals are, as a rule, more intelligent than scrubs, and of pure bred I know of no cattle more intelligent than the Jersey. If the calf has not sucked at all, you will find little trouble in teaching it. If it has, it may be advisable to let it skip a feed in order to sharpen the appetite. I have had good results from dipping my fingers in the pail and getting the calf to suck the milk from them and then gradually lower your fingers into the milk, and as the animal sucks in the milk withdraw your fingers. Above all, be patient, don't lose your temper. Warm milk should be fed from the pail twice a day during the first week. No hard and fast rule can be given in regard to the amount that should be fed. There is where some of the beginners in Jersey breeding have erred. They have looked at the small calf and decided that it must be made to grow, so they have fed it as big a feed as though it were a Holstein or a Short-horn. It is better to underfeed a trifle than to overfeed.

Arrange small pens, or tie the calves up when feeding them so that they cannot suck one anothers' ears. At the close of the first week commence to reduce the whole milk and substitute skim milk. Be sure that it is blood heat (about 95 degrees.) As the substitution progresses add a small quantity of flaxseed gruel or the ground flaxseed. Where you have use for a small quantity only, do not

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

make the gruel, as it sours readily and is then unfit for food. At the end of the second week the calf should be receiving skim milk and no whole milk. The flaxseed meal can be increased to a desert spoonful. When the calves are about four weeks old, I would remove them to an open pen with small stanchions with feeding boxes in front along one side. The calf soon learns its place and goes to it when feeding time comes around. The advantage of this is, that the pails are not upset, and when the calf is through drinking you can give it a small amount of hay or grain. Keep the calves in the stanchions for a half hour after feeding and by that time they will not be inclined to suck one another. When the calf is about six weeks old, give it a bunch of clean hay to nibble on, and a handful of whole oats or rolled barley in the manger. Water and salt should be provided. It seems almost unnecessary to emphasize the importance of cleanliness. A clean pen, clean bedding, and clean pens for feeding. A large part of the mortality among young calves could be prevented if the farmer would pay more attention to cleanliness. Dirty pails and sour milk are common causes of scours. If you are feeding creamery skim milk and cannot be sure of its sweetness, it is better to see that it is always sour, as you will have less trouble than when you are feeding one day sour and another sweet. You will undoubtedly have some trouble with scours, and where it is caused from overfeeding or from sour milk, I have found no better remedy than raw eggs. Put egg, shell and all, into the calf's mouth and break it there, holding the calf's jaws until everything is swallowed. Feed these two or three times a day. The eggs supply considerable nourishment and the whites are good for the lining of the stomach.

Exercise must not be neglected, some breeders do not advise it, as they fear that the calves will have crooked legs. I will risk the legs in favor of a good constitution. Without that your cattle will never be the most valuable type of dairy animal. Remember that what has been said applies to dairy calves. You must, therefore, increase the hay as rapidly as possible, so as to encourage the development of the digestive organs. You must not feed too heavily or you will start that disposition to lay on fat that is ruinous to a good dairy cow.

California Questions About Milking, Overrun and Alfalfa.

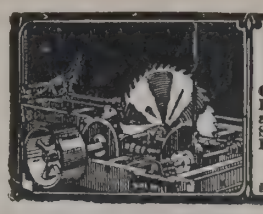
ED. HOARD'S DAIRYMAN:—I'm green, so green that even the cows try to come and lick me, or at least some of them are always anxious to have me rub their heads and necks. But to come to the point, can you tell me when I can tell when I'm through milking a cow? I milk full hand, dry teat, until I get practically no milk; if I strip the cow, I can get maybe a pint more milk, which is very rich. Some people say "milk every drop out of the udder, and to do so I must strip the cow, which Mr. K. and Mr. J. tell me is not good for the cow. I know that the quicker you can milk a cow the better, but what is worth doing at all, is worth doing well."

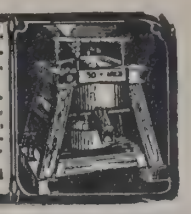
In the issue of June 5th (of the current Vol., page 391,) R. H. P., says:" The way I figure etc., would be stripping that was left in the udder." Then again— "This would amount to $12.00 a month, to say nothing about the harm that he was doing the cows by not stripping them clean;" which way shall I do? Is the Hugulund method of milking a good subtitute for stripping?

The other day I was discussing the question of over-run of cream. Here we receive one-fifth; now taking the way you calculate total butter (page 367, current Vol.)—divide test of butter fat by per cent of fat in butter. But my informer told me that this wasn't right—he is an agricultural college graduate. What do you say? He says add one-fifth of butter fat to butter fat, to get total butter. In my case, if he be wrong, I lose .10 per cent a pound of butter from every 60 lbs. of cream I send to the creamery. At least this is the way I figure; our test is 39%.

Several times I have seen this statement or one very much like it—page 423 current Vol. "So far as present experience has gone, about the only condition which seems fatal to alfalfa prospects is soil water too near the surface." "Not safe to advise anyone to try to raise alfalfa on land where standing water comes within eight feet of the surface."

Our experience has been that we have gotten five crops of alfalfa a year, on sandy, unirrigated, river bottom soil, with water six feet from the surface, but we lost our alfalfa field the third year because flood water stood on it for three days. Yet it has been the experience of our neighbors that the alfalfa that staid with them the longest has been on land with water within six feet and less.





I would not give HOARD'S DAIRYMAN for any dairy paper I've seen yet and I'm enjoying it immensely. Next year I'll send you my herd report, for as yet we haven't a pair of scales or a Babcock tester. H. M. McK.

Santee, Cal.

We consider a modicum of "stripping" with the thumb and finger not only permissible but really essential. When the present writer was at his best as a milker, his plan was, when the udder was nearly empty, to grasp quite a bit of the lower part of the udder, where it joins the teat, with his thumb and first finger and thus crowd down the contents of the milk cistern into the teat and expel the milk by closing the remaining fingers upon the hand, changing about once or twice from teat to teat. Every milker, however, has his peculiar idiosyncrasies, and in a way, can be allowed to follow them. Results are more important than methods and the udder should be completely, or practically so, emptied. It is to be remembered, however, that the udder is something more than a mere cavity, like the inside of a jug. It is made up of cells, which are broken down and form milk as the process of milking goes on, and it is therefore to be expected that a cow cannot be milked so completely dry that it will not be possible to get a few streams or drops after a lapse of even a few seconds.

In regard to the over-run question, we may say here as we have said hundreds of times before, that it will vary from time to time, because the resulting butter varies more or less and conditions are never alike on different days. When a test of cream is properly made, it is quite possible to obtain one-fifth, or 20% overrun, but this is probably more than can be expected in all creameries, at all times, and especially in what are known as the gathered cream creameries, unless the samples are very accurately taken, and are proportioned to the amount of cream delivered.

Our correspondent's experience with alfalfa is to the point and we are glad to have it. HOARD'S DAIRYMAN aims to be conservative and it has not hitherto advised seeding to alfalfa where the permanent ground water line was not more than six feet from the surface lest failure should result. But we live to learn and we have learned a good deal in recent years about alfalfa and there is probably much more to learn yet. Our own personal experience with alfalfa is teaching us many things and among them is the probability that, contrary to current opinion, alfalfa may become the most profitable sort of crop for a short rotation. We are not prepared to advocate this just at present, but experience with a small field of alfalfa plowed this spring seems to indidate that alfalfa may become, par excellence, the crop for short rotations. If any of our readers have had any experience in in this line, we should be very glad if they would give us the results.

Rippley's Fly Remover

Instantly removes all flies, mosquitos, lice and other insects from cattle, horses and other animals sprayed with it. It is healing to any sore. Animals rest easy and feed quietly all day. Cows give ¼ more milk, which is a big saving. 1 gal. will protect 50 cows. Endorsed by the best class of people. Order at once and secure agency, you can sell hundreds of gallons. 1 gal., $1.10 2 gal., $2.10; 5 gal., $4.50; 10 gal., $9.00. RIPPLEY'S Special Sprayer for applying same, 65c; 4 gal. Compressed Air Sprayer for applying same on large herds, $5.00; 5 gal., 5.50. Money refunded if not as represented. Our Breeders' Supply catalog mailed free; tells how $8.00 per head can be saved by using Fly Remover; ½ bbl. lots of 30 gal., $25; freight paid on 20 or 30 gal. lots.
Gentlemen:—For three years I have been experimenting with different things to keep flies off my cows, but not until I tried your Fly Remover and Compressed Air Sprayer was I successful. I used this last year and found that it costs less than one cent per week per cow. With your Compressed Air Sprayer it takes but a few minutes to put it on, and the result has been that my cows were free from flies, and during the year gave 6400 pounds of milk each, which made 324 pounds of butter per cow. I can heartily recommend it to all stock owners.—JOHN ARMSTRONG, President State Board of Agriculture, De Smet, S. D., June 4, 1901.

"Going After their Dinner."

ED. HOARD'S DAIRYMAN:—On this page is a fair likeness taken under difficulty, owing to the persistency of the "bossies." Persistence, inherited probably from their persistent mother.

"Gold Bargain" was bred by General George E. Bryant, of Madison, Wisconsin, and carries the Jersey blood of "Omaha" and "Metah", a pair the General bought in 1870, at the Atlantic seaport, of the late Col. George E. Waring, the famous civil engineer who made New York City clean. This cow was selected and bought by Professor W. L. Carlyle, of the University of Wisconsin, from the herd of General Bryant, and at the station given a yearly test. She was known to be a good cow, but General Bryant did not regard her as his best cow, nor does he now, though she holds the champion test at the station of all breeds in all past time. We append her pedigree. Scan it.

Gold Bargain 91634	Gold Bugler 20036	Gold of St. Lambert 16744		
		Fanny Bugler 19911	Bugler 2127	
			Metah's Queen 4886	Omaha
				Metah
	Big Bargain 76274	Omaha Jr. 15367	Omaha	
			Metah	
		Baby Ryan 42139	Ryan 9891	Omaha
			Metah's Baby 9710	Metah

There is no hap-hazard, come-by-chance breeding on the page. Every bull is a sire of fourteen pound cows; every cow is in the fourteen-pound list as well as a producer of fourteen-pound daughters. Mark the three out crosses: Gold of St. Lambert, Bugler to Lawrence; and Lady Mary, Ryan to Gold Basis and Gilderoy.

Following is Prof. Carlyle's testimony:

University of Wisconsin,
Agricultural Experiment Station,
MADISON, Wis., Feb. 23, 1903.

General George E. Bryant,
Capitol Building.
Madison, Wisconsin,

DEAR GENERAL:—I have your favor of recent date asking for a report of the yields of milk, butter, etc., of the cow "Gold Bargain" that we purchased from you. In the year just past this cow gave 8,395 pounds of milk with an average of 5.98 per cent fat. This yielded a total of 502 pounds of butter fat, and 585 pounds of butter. I would be very glad, indeed, to have you get a photograph of her, but it would be well for you to wait a week or two when she will be fresh again and you will get a much better photograph of her udder. The cow is looking very well, indeed, and we are proud of her.

Hoping that you will let me know when you can visit the barns, and I will arrange to meet you, I am,

Yours very truly,
W. L. CARLYLE.

When the artist went to make the photograph he found not only the cow but twin calves, and that was words, as plain as a cow could speak them: "These prove that I belong to a milking family."

Madison, Wis. X

New York State Milk Associations.

ED. HOARD'S DAIRYMAN:—It would be interesting to know how many dairymen are interested directly in supplying milk for New York City. The number must be well into the thousands, besides there are other thousands who sell milk at prices gauged by the price which the milk shippers receive. There can be no doubt that the middlemen have in years passed so crowded down the price of milk that there were no profits left the producer. A sort of organization was what accomplished the effect for the dealers, though it may be doubted whether the organization might not have been more liberal with the producers, had it been more thoroughly organized, and in better business hands.

Organization on the part of the producers was necessary to meet the organization of the dealers, and an attempted organization of that description is now at hand. It is interesting to note that whenever there has been any organization of producers, even of the rudest kind, the dealers have been anxious to conciliate the farmers who thus organized. Whether the farmers will yet get a thoroughly efficient organization is a matter for the future to answer.

At the present time there are three organizations at work, all in harmony it is said, besides the locally organized co-operative creamery associations.

These are the Five States Milk Producer's Association and the Co-operative Creameries Association, both of which have been described, and which have acted in harmony. Now there is set before the people the People's Pure Milk Company, regarding which there is much to learn.

A meeting of the F. S. M. P. Association and of the Co-operative Creameries Association was called to meet in Binghamton, July 1st, 1903. The committee that was appointed at the March meeting to secure, if possible, the signatures of enough officers of co-operative creameries to bring the list up to 40 or over, succeeded in their undertaking, and the meeting was expected to hear reports of committees, adopt a constitution and by-laws for the co-operative creameries association, and to hear the proposition of the People's Pure Milk Company. All this was accomplished.

One of the objects of the meeting at Binghamton was to bring before the milk producers, the aims and objects of the Peoples Pure Milk Co., and to take steps to complete the sale of the milk, supplied by the members of the F. S. M. P. Association. Several years ago, when the association was making its greatest progress, apparently, its officers secured the name and address of practically every farmer who was furnishing milk for shipment to New York. It is said that a power of attorney was secured from over ten thousand of these farmers enabling the sales committee to effect the sale of the milk, whenever the right opportunity should offer. The number of cows kept by each farmer was also ascertained and a conservative estimate made of the amount of milk that could be furnished. That estimate was for 20,000 cans daily, of forty quarts each.

With the formation of the Peoples Pure Milk Co., it is claimed that a market is at hand for the milk.

There can be no doubt but that a vast amount of work was done by the sales committee and apparently in a systematic manner. Mr. Lattimer, of Tioga Center, a member of that committee, tells me that he practically turned his house into an office, that he had as many as twenty employees at work at one time gathering statistics and tabulating, and that he has the facts in available form, by means of which the committee hopes to effect the sale of milk.

It has been suggested that no company is likely to be formed to purchase milk, or to expend much in equipment without knowing that the milk can be procured. If there should be no hitches either on the part of the purchasing company, or the Five States people who are to be the sellers, it looks as though a gigantic business deal might be made.

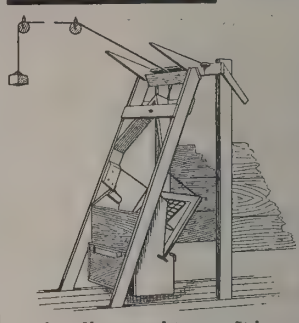
The farmer will want to gain information about many points before he turns over the product of his dairy to the new concern, and one of the objects of the meeting was to bring information to the farmer. The company is incorporated under the laws of New York at a capital of $25,000,000. Mr. Lattimer says that a large part of this capital is already underwritten, that is, the sale of the stock is guaranteed by various concerns that make a business of doing such work. The officers of the company have given their personal guaranty in writing, that they will carry the work through.

There is another point that will interest the farmers, and that is the fact that three-eighths of a cent a quart on all the milk handled for two years is to be turned to the purchase of stock of the company. This means that fifteen cents on every can is to be deducted from the purchase price of the milk, and that amount finally returned to the farmer in the form of stock certificates of the People's Pure Milk Company.

It seems rather early to make many comments, and it is perhaps best to await developments. The matter concerns too many farmers to be overlooked. It is a gigantic affair, and the question of its success would seem to depend very much upon the personnel of the management. It is thought by some that the capitalization of the company is too high, but the claim is made that enough can be saved by proper handling to pay a dividend on the capital named.

It should be understood that a large proportion of the dealers in New York have already signified their intention of becoming members of the new company, turning over their plant and equipment to its management, or are considering the proposition. With a company composed of producers and dealers, there should be harmony. It may be well to remark that the term of contract for supplying milk, is five years, beginning October 1st, 1903. The contract price ranges slightly in advance of that offered by the Bordens for

Dietz Lanterns



make the way plain in night work or travel. Always shed a strong, clear, white light, with no choking, sooting or smoking.

Over Sixty Years the Favorite.

Made in many styles and sizes for all purposes, as hand lanterns driving lamps, post lamps for streets, for front of country residences church doors, etc. CATALOGUE SENT FREE.

CONCERNING OUR ADVERTISERS.

REAL HORSE POWER.

A machine that transmits the entire effort of the animal. It is highly probable that no small steam engine yields the power claimed for it; even fewer "horse powers" do. From the effort of the animal heavy mechanism has heretofore subtracted a great portion of the power, and it has remained for a Vermont firm to produce an ideal horse power. This power is known as A. W. Gray's Sons' Horse Power. It is manufactured at Middletown Springs, Vermont. It is not a new thing, but its later improvements are all new and all very valuable—insuring lightness with strength; ease of operation, with great durability; thoroughly good construction, with low price. These powers are in general use for running threshers, wood sawing machines, cream separators, churns, ensilage cutters, cider mills, pumps, etc, and for like uses. The mechanical devices and the method of construction that makes the Gray powers so very desirable are set out in a most interesting manner in the 1903 catalogue. This catalogue treats the entire subject in a very comprehensive manner, going over the question of applied power, effect on the animal, conditions and results generally. Any one that needs power can ill afford neglecting this book. Messrs. A. W. Gray's Sons also manufacture threshers, wood-saw machines, ensilage cutters, etc., which are also treated in this catalogue. Like their celebrated power, these machines are of the very best construction, and have the best labor saving attachments and devices. Any one contemplating a purchase of power or machine may have the catalogue free by addressing A. W. Gray's Sons, Middletown Springs, Vermont.

The firm of J. K. Wilder & Sons of Monroe, Mich., manufacturers of Feed and Ensilage Cutters, Wind Elevators, Horse Powers, Land Rollers, Clod Pulverizers and Soil Packers, and a general line of Agricultural Implements, have been succeeded by the new corporation known as the Wilder-Strong Implement Co., organized under the laws of the State of Michigan. The capital stock of the new organization is $50,000.00. The officers of the new concern are as follows, viz: Wm. H. Strong, Pres., J. K. Wilder, Vice Pres., E. S. Wilder, Sec'y and Treas. Wm. H. Strong, the new member of the firm is a well known business man of Detroit, Mich. The new company will continue to manufacture the lines of goods formerly made by J. K. Wilder & Sons, but with added capital and the added energy of the new firm member are planning to double their former output.

TORMENTS OF FLIES.

Knowing that our readers will be pleased to learn of a reliable preparation that will protect their cows and horses from the torments of flies and mosquitoes, we call your attention to the Fly Remover advertised by the Rippley Hardware Company, Grafton, Ill. We have received many reports stating that it would protect stock and horses from flies, mosquitoes, and lice, also that it will not injure them when directions are followed; also it is non poisonous. Parties who use it claim their animals are protected all day and feed quietly. Horses work and drive better. We have seen many strong endorsements on these goods, which we know to be from very responsible parties. The cost of using it is so small as compared with the comfort your animals derive, you cannot invest a like amount of money that will realize a greater profit. We request that you give it a trial at once. Send for their 100-page Breeders' Supply Catalogue. See their advertisement elsewhere in this issue.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Indigestion.

Can you tell me why cows chew old bones? Is it a lack of phosphate? If so, do cows yield milk to their full capacity under these circumstances? If not, do you think it would pay to supply phosphate to pastures in shape of South Carolina rock and what quantity per acre? L. S. ST. J.

Canajoharie, N. Y.

ANSWER.

Chewing bones and other unnatural substances is usually an indication of an acid condition of the stomach, which brings about this unnatural desire, and is a form of indigestion. Give each animal ½ oz. of bicarbonate of soda in a little water twice, daily until relieved.

Obstructed Teats.

One of my cows is very slow to milk in the front teats. There appears to be an obstruction near the upper end of the teat which only allows the milk to pass slowly and it takes twelve or fourteen minutes to milk those two quarters and she does not give over three gallons per day. E. N. R.

Franklinville, N. Y.

ANSWER.

There is an obstruction in the teats, perhaps a stricture, which can be remedied by the use of a teat bistoury with which you can lay open the obstruction and gain a free flow of milk.

Sucks the Cows.

I have very fine young bull that sucks my milch cows. Is there a preventive for this?

Hopkinsville, Ky. R. W. W. & SON.

ANSWER.

An ordinary calf weaner applied to the nose will remedy your case.

Lump Jaw.

Please give symptoms and traetment of lump jaw in cattle. Can a three months old calf have it?

Marshfield, Ore. M. V.

ANSWER.

An enlargement usually appears in the vicinity of the most prominent part of the lower jaw, which will break open and discharge a creamy pus. This pus will trickle on the grass while the animal is feeding in the pasture, and other cattle will follow and eat the grass with the pus, which contains the infectious germs, and in this way it will spread through the entire herd. After the pus is all discharged from one enlargement, it usually disappears and others will follow in the immediate vicinity. It does not appear in calves so young, as a rule.

Horse Owners! Use

GOMBAULT'S **Caustic Balsam**

A Safe, Speedy, and Positive Cure

The safest, Best BLISTER ever used. Takes the place of all liniaments for mild or severe action. Removes all Bunches or Blemishes from Horses and Cattle. GALL POWDER

the most effective cure ever known for healing sore shoulders, backs and other skin abrasions; at druggists, or by mail $1.00. MOORE BROTHERS, Veterinary Surgeons, Albany, N.Y. "Facts for Farmers and Breeders," sent free.

Cows Made to Breed

Inject with Hood Farm Breeding Powder when they fail to breed, do not clean, are irregular; also after abortion. Of greatest value to breeders and stock owners. Dollar size by mail, $1.15; large size, four times more, to any railroad express point in U.S. $2.75. C. I. Hood & Co., Lowell, Mass.

ABORTION

Can be successfully treated with Anti-Abortion Serum. Easily administered and permanently cures. Information free.

DR. ROBERTS

VETERINARY REMEDY CO., 528 Grand Ave., Waukesha, Wis.

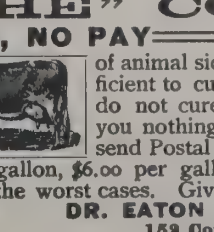
"Just as good?" "Just as good!" Did you say? "Just as good as Veterinary Pixine!!" The dealer who tells you that is mistaken. He does not know.

FACTS AND TESTS PROVE IT!

Emery, Ky., April 9, 1903.

I feel it my duty to tell what Veterinary Pixine did for a horse of mine. He was cut with a knife between the fore legs three inches deep and two inches long, which every minute would gap open. I used several different kinds of remedy without success, even to having some stitches taken. Nothing did any good and it kept swelling and became feverish. I almost gave up hopes of getting him well. In the columns of the Ohio Farmer I observed your advertisement and, as it was the last chance, I purchased a box at the druggists and used it as directed and before the box was used up the cut was entirely well. I intend to keep a supply on hand for emergency cases if I have to pay a dollar a box for it. Please accept my thanks for the good I have received from its use, and if you choose you can use my name and testimony.

W. S. CAMPBELL.



This penetrating, stimulating, soothing, absorbing, antiseptic, healing ointment heals from beneath the surface by disinfecting the parts, subduing inflammation and stimulating healthy granulations, not by drying and scabbing, and stimulates growth of hair, natural color. Makes quick, clean and healthy cure; heals stinging, burning, chronic saddle and collar galls, hopple chafes, abscesses, caked bag, cow pox, and hoof rot. It penetrates, stimulates, soothes and heals while horse works. Money refunded if it fails.

Price, 2-oz. box 25c; 8-oz. box 50c; 5-lb. pkg. $4.00, at all druggists and dealers or sent prepaid.

TROY CHEMICAL CO., Troy, N. Y.

Also Manufacturers of "Save-the-Horse" Spavin Cure. $5.00 a bottle. Send for copy of guarantee and booklet.

COWS RELIEF

Expels the terror of caked bag, the annoyance of sore teats and dread of hard milkers.

Used Exclusively at Model Dairy

Guaranteed to cure caked bag in 12 to 24 hours. Invest 50c and save a cow. Makes milking easy for man and cow. Price, ½ lb 50c, 1½ lb $1.00, postpaid.

CURE "THE" COW

NO CURE, NO PAY

WRITE, giving symptoms of animal sick, and will ship you by express quantity sufficient to cure your cow with full directions for use. If I do not cure the animal the advice and Cure "the" Cow costs you nothing except the express charges. If I do cure it you can send Postal order for cost of remedy—$2.00 per quart, $3.50 per half gallon, $6.00 per gallon and pay for what you use. Generally half a gallon cures the worst cases. Give Postoffice and Express office with your order. Address

DR. EATON J. CROSS, 153 Congress St., Troy, N. Y

Alfalfa Silage in California.

Grading up a Herd.—Cutting Hay Into Mow.—An Editorial Statement Corrected.

ED. HOARD'S DAIRYMAN:—Conditions are very different here from those in the east, but the cow is, or may be, the same everywhere and there is always something of interest to me in every issue of your paper.

Alfalfa silage is certainly a success here, but hardly equal to corn.

Our first crop of alfalfa is, on old ground, always full of foxtail and these sharp beards are very troublesome in the hay.

In the form of silage they are as soft as silk. My experience, covering four years, convinces me that well matured alfalfa makes the best silage. The fox tail is then nearly mature and water is run into the carrier continuously from a ¾ inch pipe. Not quite so much is added though as is present in immature alfalfa, for the juice seldom exudes from bottom of silo as it does when very young grass is put in.

Am grading up a herd of all sorts of native cows by using a pure bred Jersey bull. Have not been at it long enough to tell just what improvement will be made, but the heifers last year averaged as well as the old cows. Average yield per cow 220 lbs. butter fat, returns $54.-20, plus calves and skim milk pigs. Am aiming now at the 300 lb. mark and when I reach it will try for 400 lbs.

Noting an inquiry in last paper about cutting hay direct from the field, will say the immense feeding farms of Henry Miller surround us on nearly all sides, and this experiment was tried here last year. It was so successful that his head superintendent told me they would put in 36 in. machines (they now use 24 in.) and cut all hay as it came from field, within two years. Must take exception to your statement that hay so cut would not pack as closely as long hay. I built a little hay barn, last fall, 16×24 on ground with 16 ft. posts. Filled it to the plates with no tramping except what was done in scattering the feed (twice a day) and put in 20 loads. It would have been impossible to get in 10 such loads, uncut, with any reasonable amount of tramping. F. B. M.

Dos Palos, Cal.

We are very much obliged to F. B. M. for the foregoing contribution to our columns. What he has to say about alfalfa silage is very much to the point and should have the attentive consideration of such of our readers as may contemplate preserving alfalfa in this way. We regret, however, that he did not extend his communication a little further and tell us what the effect upon the subsequent cutting was when the first crop of alfalfa was allowed to become so mature.

We shall be very glad to hear from this correspondent further and especially as to his success in grading up his herd.

More than all else, however, we are especially gratified for this correspondent's correction of the editorial statement in regard to cutting hay into the mow directly from the field. In the nature of things, it is impossible for the editors to answer from experience the thousand and more questions submitted to them every year and it is not to be wondered at that when they get beyond the domain of personal experience, they should sometimes blunder, as in the instance referred to; but in such cases, they are very glad indeed to be corrected and they would esteem it a favor if more of their readers felt at liberty to criticise the editorial statements and opinions.

Cheese Scoring Tests at the Michigan Station.

ED. HOARD'S DAIRYMAN:—The Michigan Cheese Scoring Test is the only test of its kind in existence, and we are glad to say that it is a complete success. Our cheesemakers are very much interested in this test, and we believe it will accomplish a great deal of good.

In the June scoring there were 34 entries of cheese and 55 entries of butter. That these scoring tests are accomplishing the object for which they were inaugurated is illustrated by an abstract from a letter of one of the participants, which reads: "We are well pleased that we entered the contest on account of the information it gives. It will always stimulate us to better efforts."

After each scoring of butter and cheese a criticism of the score is sent out to the butter and cheese makers individually.

The following copy shows something of the character of these criticisms:

CRITICISM.

"I enclose herewith score cards showing wherein your cheese was defective.

The chief defect in your cheese was in the flavor. Both the flavor and the texture showed that the milk from which this cheese was made was strongly gassy. During the summer months there will always be more or less of gassy milk, even with the best of care in handling the milk. It, therefore, behooves the cheesemaker to follow the best methods known in combating these gassy milks. One of the best means of overcoming the gassy effects of milk is to add a liberal amount of fine flavored sour milk, or what we call "starter" to the milk in the morning before setting. The amount of starter that may thus be used depends somewhat upon the amount of acidity already present in the milk. It may be said that the amount of starter used may vary from two to five pounds for every one hundred pounds of milk. The good effects from the addition of sour milk in combating gassy milk comes from the antagonistic relation that exists between the souring germs and the gas-producing germs. The effect of adding a heavy starter is that of either killing the gas germs present in the milk or retarding their action. We feel confident that if you can so instruct your patrons as to have them bring you a fairly sweet milk, one that will permit the use of at least from two to three pounds of starter to one hundred pounds of milk, that the defect you experienced from gassy curds will be largely, if not entirely, overcome."

The information bulletin that is occasionally sent with the criticism is as follows:

INFORMATION BULLETIN.

STARTERS.

A good starter is a clean flavored batch of sour milk or skim milk.

Starters are used to overcome bad fermentation in milk and cream.

There are two kinds of starters: (1) Natural. (2) Commercial.

A natural starter is ordinary sour milk or skim milk.

Commercial starters are made in laboratories by selecting and breeding the right kind of acid producing germs.

Commercial starters are giving very good satisfaction and their use is rapidly increasing.

Among the important of these starters or cultures may be mentioned:

1. Douglas Culture, manufactured by O. Douglas, Boston, Mass.
2. Keith Culture, manufactured by S. C. Keith, Jr., Charlestown, Mass.
3. Hansen's Culture, manufactured by Hansen's Laboratory, Little Falls, New York.

Commercial starters are prepared as follows:

Heat four pounds of milk, or preferably skim milk, to 160 degrees F. Keep at this temperature 10 to 15 minutes, then cool quickly to 70 degrees F. Now introduce bottle of Commercial Culture and let stand till milk has just thickened. This thickened milk is the starter.

The starter is carried on from day to day as follows:

Heat and cool milk as explained above (pasteurize) and introduce into this enough of the four pounds of starter already made to sour the milk in 24 hours at a temperature of 70 degrees F. The amount required is generally 3 to 4 per cent; that is to every 100 pounds of pasteurized milk we must add 3 or 4 pounds of old or mother starter. The remainder of the old starter is added to the milk used for cheese making.

By always saving a little of the old starter and putting this into milk newly pasteurized (heated and cooled) it will be seen that in this manner the original ferment can be carried from one batch of milk to another for weeks.

The average amount of starter to every 100 lbs. of milk in cheese making is 3 lbs.

The best way to handle tainted or gassy milk is to use a liberal amount of starter.

JOHN MICHELS,
In Charge of Contests.
Michigan Agricultural College.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

A Wisconsin Herd Record.

ED. HOARD'S DAIRYMAN:—I send you a report of my dairy herd of Holstein-Friesian cows, 32 head, for year ending April 1st, 1903, as follows:

Pounds of milk for year, 248,000; money for year, $2,554.40; average milk per cow, 7,750 lbs.; money expended for concentrated feeds, $320, leaving a net balance of $2,234.40 or $69.82 per head. Nine of the 32 cows were two-year-old heifers.

This milk was taken to a cheese factory; price per cwt. $1.03. W. H. J.

Watertown, Wis.

For the lasd's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it.

Special Offer of Fine Dairy Farm
ADJOINING RED WING, MINNESOTA.
174 ACRES—140 under high cultivation, balance good pasture and woodland. Has complete machinery for Dairy, with power, etc., and all machinery for cutting corn. Two large silos, sufficient to hold feed for 50 cows, and large barn to tie up 70 head. One new house—could not be built for less than $2,500; another good house for help. Large horse barn and granary. Improvements could not be duplicated for less than $7,500. Monthly receipts over $600. All for sale at $12,000.
H. A. CAMPBELL, 107 E. 4th St., St. Paul, Minn.

DO YOU WANT A HOME
in Central Wisconsin? We offer very desirable lands to actual settlers. Our lands are in Marathon County and are some of the very best hardwood, agricultural and dairy lands in the state. Deep clay loam soil. Good water easily obtainable at but little depth. Country opened with good roads and well populated.
Schools, both public and parochial, churches, general stores, bank, creamery, etc., within easy reach. Ready market for farm and forest products.
Terms reasonable. If you desire to improve your condition write for further particulars to
RIETBROCK LAND & LUMBER CO., ATHENS, WIS.

Buy You a Ticket to CROOKSTON, MINN., and call upon
The Polk County Land & Loan Company
For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.
360 acre farm, 4½ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.
This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,
160, acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

FOR SALE
My fine country home and dairy farm of 120 acres within 1¼ miles of Waukesha city limits and electric line. This farm is well watered and fenced, and well equipped with buildings painted and in good order; 10 acres wood lot, balance under plow and in high state of fertility. For particulars address
O. P. CLINTON, Waukesha, Wis.

Our New Patent
and Great sales are the talk of all who know of them. A fortune has been made by the patentee and the farmer in a short time. For seven months the sales were over $350 00 per day. Something good can't be gotten for nothing. By putting $500.00 and upwards into this business it will be the best paying investment we know of. Farmers using the machine say that they would not do without it for two, three, and ten times the price. Common farmer can handle it in a very paying way. We can prove the great selling qualities of this machine by bank account, the bankers themselves, and the farmer. Our plan is fair and honest. Best bank references. Car fare one way will be paid to responsible men whether they buy or not. Address

Official Record of Holstein-Friesian Cows From April 18 to May 16, 1903.

This class of records are made under the supervision of agricultural colleges and state experiment stations. In every case a representative of such an institution, paid by the institution, oversees the entire work. The samples of milk are tested by him in duplicate and a composite sample is forwarded by him to the station or college to be tested there. In cases of phenomenal production re-tests are also made during which the cows are constantly watched that by no possibility the contents of their udders can be increased by the injection of milk or fat.

During this period reports of 75 cows have been received: Seven have thirty-day records, two have twenty one-day records and all have seven day records.

Jessie Maida 48805—4 years, 8 months: in 30 days: Milk 2,325.8 lbs., fat 78.753 lbs., equivalent butter 91 lbs., 14.1 oz., best seven days commencing 30 days after calving: Milk 594.1 lbs., fat 20,611 equivalent butter 24 lbs., 0.7 oz.

May DeKol Pietertje 56687—2 years 4 months:

$500 REWARD FOR WOMEN

WHO CANNOT BE CURED.

So uniformly successful has Dr. Pierce's Favorite Prescription proven in all forms of Female Weakness, Prolapsus, or Falling of Womb, and Leucorrhea, that, after over a third of a century's experience in curing the worst cases of these distressing and debilitating ailments, Dr. Pierce now feels fully warranted in offering to pay $500 in cash for any case of these diseases which he cannot cure.

IT STANDS ALONE.—The "Favorite Prescription" stands alone, as the one and only remedy for these distressingly common forms of weakness, possessed of such positively specific curative properties as to warrant its makers in proposing, and binding themselves to forfeit, as we, the undersigned proprietors of that wonderful remedy hereby do, to pay the sum of $500 in legal money of the United States in any case of the above diseases in which after a fair and reasonable trial of our treatment, we fail to cure. No other medicine for the cure of woman's peculiar ailments is backed by such a remarkable guarantee; no other medicine for woman's ills is possessed of the unparalleled curative properties that would warrant its manufacturers in making such an offer; no other remedy has such a record of cures on which to base such a remarkable offer.

Therefore, *insist* on having Dr. Pierce's Favorite Prescription and turn your back on any unscrupulous dealer who would insult your intelligence by attempting to foist upon you some inferior substitute, under the plea that "it is just as good." Insist on having the article which has a record of a third of a century of cures and which is backed by those willing to forfeit $500 if they cannot cure you.

In cases attended by a leucorrheal drain a solution of Dr. Pierce's Lotion Tablets should be used conjointly with the use of the "Favorite Prescription." They are sold by all druggists, or sent post-paid to any address, on receipt of 25 cents in stamps. Send 31 cents in stamps for Dr. Pierce's Common Sense Medical Adviser. Address WORLD'S DISPENSARY, Buffalo, N. Y.

Weak and sick women are invited to consult Dr. Pierce, by letter, *free*. All correspondence is held as strictly private. Address Dr. R. V. Pierce, Buffalo. N. Y.

Dr. Pierce's Pellets cure biliousness.

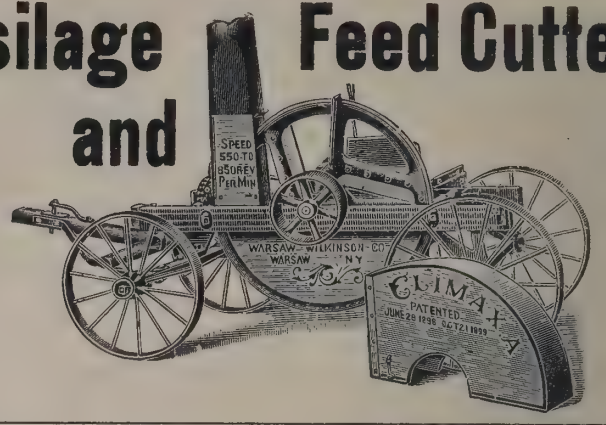
How to Make Clover Grow on Sandy and Prairie Land and in Dry Sections.

A correspondent writes us how he succeeds in growing clover on sandy land. The soil is very sandy in that part of Michigan, with no clay hard-pan under it. Unless one can grow clover on such soil it is hard to keep up the fertility. Our friend writes that he has no difficulty at all in getting good crops of clover. He sows on corn stubble without any nurse crop. He goes over the land twice with a spring tooth harrow, when it gets dry enough to work nicely in the spring. Then the clover seed is put on with a seeder and covered with a fine-tooth harrow. When the weeds get well started, along in June, he mows them off and leaves them on the field, of course being careful to not bunch them up so any clover plants will be smothered. This is the whole story in a few words; but it is a story of great value to farmers living on sandy land, or where it is difficult to get a good stand of clover on account of a lack of rain. It is substantially what the writer has advised at Institutes all over the state of Minnesota, where there is difficulty in making clover grow. Some of the soil is sandy; some prairie. The plan is equally good for both kinds. Lack of moisture is one great trouble there. The crop starts and then is injured by dry weather before it gets rooted deeply enough to reach permanent moisture. Now how does sowing on corn stubble help the matter? Well, one makes a nice seed bed on the surface two or three inches deep, and puts the seeds in it. They sprout and the roots start downward. Almost at once they get into solid earth, the lower part of the soil that was turned over for corn. In this solid ground capillary action can take place. Water is creeping up slowly from below as long as any is left. Water will rise through this solid soil; it will not rise through loose soil. Supposing you sow on sandy, or prairie soil that was plowed and rather loose to the depth of the furrow. The plants start; then a dry, windy time comes. The moisture dries out of the loose soil down under the roots and around them. Then they die. When the seed is within an inch or so of solid ground such a result can hardly take place. The roots will get into the solid ground and find moisture. It will be well to add that on sandy and loose prairie soils the seed should be put down about two inches deep; some say even deeper. I would not work the corn stubble more than three inches deep. And it should be harrowed over once, as soon as dry enough to work in the spring to check the evaporation of water. Then later, put on the rest of the tillage. Make the surface very fine and nice. Mr. Wade sows no nurse crop, and mows off the weeds when they get well started, say about eight or ten inches high. This is a great point on land where there is a lack of moisture, or in dry regions, and also where the soil is not very rich. A nurse crop takes plant food and water out of the soil, just what the young clover plants need. If there is enough for grain crop and clover, too, all right. Often there is not. Then the clover has a better chance sown alone, provided one does not let the weeds grow. In round numbers it takes from 300 to 500 tons of water out of the soil to grow a ton of dried oats, or wheat (grain and straw together), or weeds. In a dry section, or a dry soil, clover needs this water. Leaving out the so-called nurse crop and mowing off the weeds early in their growth saves it for the clover. It does more. The clippings of the weeds make a fine mulch on the surface, which tends to check the evaporation of water from the soil. It also increases the available fertility somewhat. In a slight degree it is following out nature's way of increasing fertility. Grass grows up and dies down. Leaves fall from the trees. Thus nature slowly made prairie and upland fertile, saving the moisture at the same time with the mulch. These principles are as old as the hills, but in our haste we sometimes loose sight of them. Sometimes it might be best to mow the weeds off twice, clipping the clover a little also. It will tend to increase its root growth. In some parts of the North it is not too late to sow clover alone now. And these same principles can be applied in other ways. If you sowed clover seed with oats this spring, mowing them as soon as they head, for hay, will save water for the clover, and perhaps save a seeding that otherwise would fail. If the clover was sown on your rye or winter wheat, don't let weeds grow up in the stubbles. This is a point I was always very particular about. It the weather is dry in July and August, this year many thousands of acres of young clover will fail simply because a heavy crop of weeds is allowed to grow up and take the plant food and water. Many P. F. people, however, now mow their stubbles. Study over these matters, my good friends. Profits in farming do not come from hit-or-miss work, as a rule. Learn the very best ways; then do them. and promptly on time. If other methods fail this year, perhaps it will be best to arrange to sow clover alone on corn stubble next spring.—T. B. Terry in *Practical Farmer.*

A Michigan Herd Report.

Ed. Hoard's Dairyman:—Below find report of my herd of grade Jersey and Guernsey cows, year ending April 1st, 1903. Number of cows figured 13½, having 13 from April 1st to December 1st when one cow was sold, and one two-year-old heifer coming in November 1st. Another two-year-old coming in February 10th which, I think, makes figure of 13½ for year about right.

Total milk	83,372 lbs.
Butter fat	4,360.92
Average test	5.23%
13½ cows	6,175 lbs. milk each
" "	323.03 lbs. butter fat each
Adding 1-6 overrun	376 " " " "
Cash received for butter	$989.48
" " " per cow	$73.29



Cash returns are net receipts from creamery. Twelve cows freshened in fall. Winter feed, silage, clover hay and shredded corn fodder. Grain ration, maximum 3 lbs. each bran and Atlas gluten meal, daily in two feeds on silage. Year ending April 1st, 1902, feeding less well balanced ration and without silage, same herd produced average per cow 5,340 lbs. milk, 266.9 lbs. butter fat.

Grass Lake, Mich. C. B. C.

SILOS
COMPLETE.
ROOFS,
Hoops, Lugs, Doors and Frames.
BUSHEL
Farm Crates from short stock in Silo and Tank construction.
SOLD CHEAP ALL ILLUSTRATED for the asking.
WILLIAMS MFG. CO.,
KALAMAZOO, MICH.

SILOS SAVE the entire crop in the best feeding form. Ours are all round. No corners nor angles to admit air and mould and rot the silage. We make them of Cypress, White Pine and White Hemlock. Four styles and 200 sizes. Fit every requirement. Nothing so good. nothing so cheap. We make all kinds of machinery for filling Silos. Catalog free.
Harder Manufacturing Co., Cobleskill, N. Y.

CLIMAX
Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and never fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them true. All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the CLIMAX in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

"OHIO" STANDS FOR BEST

The 1903 "Ohio" Blower Elevators solve the blower problem. The best in the past, they are still further improved, and will unquestionably cut and elevate the most feed or ensilage for the power required. "Ohio" machines work, and our absolute guarantee goes with every machine. New Patent Applied For interchangeable Shredder Blade for all sizes. Everything complete in one machine.

To know all the good points you must have our new 1903 catalogue or ask the man who has an "Ohio." Thousands of "Ohio" machines have made thousands of satisfied owners. Self-feed increases capacity 33⅓% and saves 75% labor feeding.

An Opinion on Red Polls.

ED. HOARD'S DAIRYMAN:—I once wrote you an opinion on Red Polled cattle, saying I should try some. Have had one crop of calves from a Red Polled bull and all but one were bull calves and that one from a heifer so poor a milker thal I sold her for beef and the calf for veal.

Last October bought a cow that came fresh Nov. 6, and if the breed is to be judged by her it is an excellent dairy breed.

One of our butchers says that they do not kill out good; does not like them for beef.

My cows are grade Jerseys, and last year made an average of about 300 lbs. I say about, for I sold some cows that had aborted and bought some more, but it was very close to 300, I think a little over.

A strange thing happened in my herd this spring, a cow 13 years old had milk fever, with right hind quarter paralyzed. She made a good recovery, and is now doing well. I had learned that old and young cows were exempt. A seven year old cow had it lightly, although had given her saltpetre as a preventive. J. K. M.

Print Cheese.

The first print cheese was made at the Wisconsin Dairy School during the winter of 1898-99. Since that time some of the details have been changed, but the general plan of the operation is the same as originally carried out. In so far as the cheese is concerned, no deviation has been made from the ususl process of making Cheddar cheese, except a modification in the pressing and the "follower" used in the press.

The following is the method at the University of Wisconsin: The cheddar cheese curd is placed in a mold or hoop of rectangular shape, the bottom or "follower" of which is a carved board. The board makes the impression of the raised letters U. W. (University of Wisconsin) and the grooves which marks the cheese into prints. Each section on which U. W. is stamped represents one-half pound, two sections making one pound. This one pound print of cheese is about the size of a one-pound print of butter. Its length and width are determined by the carving of the board, which may be made of any size or design to suit a particular trade. The thickness of the block is, of course, regulated by the amount of curd put into the mold each time. Each blook of fifteen prints is 11½ by 13¼ by 2½ inches, each print being 2½ by 2½ by 4¼ inches in size. The cheese was pressed in an upright press, the carved board being placed at the bottom of the rectangular mold and the bandage cloth cut to cover the carved board, sides and bottom of the cheese.—*Farmer's Bulletin*, Department of Agricultural.

The Separator Patent Fakir.

It must be humiliating to a manufacturer to find himself in such straits that he is obliged to admit the superiority of a competitor's goods, and to threaten prospective customers with patent litigation if they buy the superior article which a thorough trial has convinced them they should use. This seems to be the present condition of a prominent manufacturer of the "bucket bowl" type of cream separators who has recently been threatening those creamerymen who have placed their orders for the **1903 Suspended Bowl Factory Tubular Separator.** His action merely helps to illustrate the superiority of the **Tubular** and his inability to compete with it by legitimate means. Why does he not tackle us with his "patent bluff"? Because "we have been there before" and the "bluff" wouldn't work.

Just Remember Three Things.

You can get a Tubular on trial with absolutely no obligation whatever to buy or keep it, and if it is not a superior machine to any other separator made we want you to ship it back.

You can save about $200.00 if you buy a **Tubular** on our new plan, which cuts out all of the expense so common with our competitors in the sale of their inferior machines.

The Largest Cream Separator Works in the World backs you up, protects you, and guarantees absolute safety against loss from patent litigation, threatened by any disgruntled competitor, if you buy a **Tubular.**

This Taylor Stanchion

is made of angle steel lined with hard wood on side next the animal's neck. **It is lighter, neater and stronger** than any other stanchion made. Swings on chain at top and bottom and admits of greatest freedom of motion. Cattle can lay with head on side. Easiest opened and closed. **Reliable Agents Wanted.** Write for special terms, prices, etc.

JAMES BOYLE, SALEM, O.

Relative Values of Milk and Cream.

Other North Carolina Queries.

ED. HOARD'S DAIRYMAN:—I wish to get your opinions on the following points:

1. What would be the best means of my getting into communication with farmers and dairymen who are open to engagement?

2. We sell milk here at retail by the wagon method. There are no creameries in this section of the country. We find great trouble to get dairy help of all kinds, but particularly in securing men for the wagons. Would it be possible to secure men from abroad who are well qualified for this work?

3. Outside of our North Carolina Experiment Station, where would you recommend sending a young man for a few weeks' course in practical dairying?

4. A certain dairy here sells milk testing about 4 or 4½ per cent butter fat at 8 cents per quart. This same dairy sells cream at 25 cents per quart. What per cent of butter fat would you say their cream tested? Could that be a fair quality of cream?

5. With 4 per cent milk at 8 cents per quart, what per cent should cream be to sell for 25 cents per quart? What per cent to sell for 32 cents per quart, Would either of these be considered a good, rich cream?

6. In buying a separator, would I be reasonably safe in accepting the claims of the two or three largest advertisers in the DAIRYMAN regarding their machines, as fairly trustworthy? W. J.

Asheville, N. C.

P. S. Do not answer No. 6 if you prefer not to.

1. We know of no better way of getting into communication with farmers and dairymen, who may be open to engagements, or are looking for a change of location, than to advertise in the strictly dairy papers.

2. It seems to be a very difficult matter this season to obtain men well qualified for any kind of work and still more difficult to get experts in special lines. It is, however, entirely within the range of probability, not to say possibility, that an advertisement of a few lines in our reading notice columns would put this inquirer into communication with more than one bright, intelligent young man who would be very glad to take up his residence in the inviting climate about Asheville, in North Carolina. These young men might not be, at present, experienced in this special line of work, but would very readily fall into any plans submitted for their guidance.

3. There are now so many good dairy schools in so many of the states, that we must be excused from recommending one to the exclusion of the others. New York, Pennsylvania, Ohio, Wisconsin, Michigan, Iowa, Minnesota and Kentucky could be safely recommended.

4. & 5. With 4% milk selling at 8 cents per quart, one could not afford to sell cream containing over 13% fat for 25 cents per quart, or more than 17.5% fat at 32 cents per quart. Neither of these creams would be considered a merchantable article in this part of the country. Fairly good cream for commercial purposes should contain from 20 to 25% fat, and with milk at 8 cents per quart should sell at the rate of about 2 cents per quart for each per cent of fat in the cream.

6. We do not hesitate to say, that in our opinion, one would be reasonably safe in accepting the claims of any of the advertisers in this paper, regarding their machines. Of course, every manufacturer naturally thinks that his products are equal, if not superior, to those produced by his rivals. His opinions can hardly be accepted at their face value, but when statements of plain facts are made, we think they may be generally trustworthy. These facts would relate principally to the normal capacity of the machines, the efficiency of their skimming and the amount of power required for their operation.

Griswold Square Mesh Field Fence.

The best of all **Lawn and Field Fences.** Is hog proof. Manufactured in 18, 24, 33, 39, 50 and 56 inch heights; in 20 and 40 rod rolls. The narrow widths can be supplemented to any height desired by Barbed or Plain wire, or two strand twisted Cable wire. Manufacturers of **Diamond Mesh Fence. Plain, Galvanized, Barbed or Telephone Wire. Wire Nails and Hay Bale Ties.** Write for illustrated catalogues and price lists. **Dillon-Griswold Wire Co., Sterling, Ill.**

BROWN
16 to 35 Cents Per Rod.
Heaviest, strongest, most durable fence made. All wires extra large. We sell to Farmers at Wholesale Prices. Coiled Spring, Barb and Soft Galvanized Wire.
WRITE FOR CATALOGUE.
The Brown Fence & Wire Co.
222 Mason St., Cleveland, O.

IS THERE ANY REASON

why you should pay the dealer a large profit for selling you fence when you can buy the

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56. Includes postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on lable is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office orExpress Order (never by personal check), addressing Hoard's Dairyman, Fort Atkinson, Wis.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

Entered at Fort Atkinson, Wisconsin, as second-class matter.

Proving the Testing.

George P. Grout in an article on "Milk Testing," in *Farm Student's Review*, gives importance to the point of proving to the patrons by actual demonstration that the test is reliable and correct. He says:

The subject of testing milk has been touched upon lightly, but much of the time has been lost from sight in the strife to make a fine flavored butter. Butter making is truly an important factor in the successful creamery operator's occupation, but in the strife for high scores and in the endeavor to make just a little better butter than the neighboring creamery, he should not lose sight of the fact that the testing of milk has much to do with establishing the confidence of patrons and farmers. For this reason the testing should be done well, and it should be done so that all interested would feel they were getting all that is due them.

The operation is not at all difficult, there being certain rules which always apply when carefully followed. From the fact that it is not difficult and because no special credit is given a butter maker because he is expert in the use of the Babcock test, very little thought is expended in developing this part of the work. This is one of the principle mediums through which our best butter makers gain the much desired confidence of their patrons and should be a point enlarged upon.

The other day I called on a bright Minnesota buttermaker, who told me during the conversation, that the farmers tributary to his creamery had a very good grade of cows. I asked him to take a ride with me, and I then had the pleasure of seeing some of the cows. Our conversation developed that this butter maker was not only a prize winner, but that he was a student of the Babcock test.

He was not satisfied to let the testing of the composite samples each month end his care and thought on the matter of testing, but applied this test in weeding out the poor cows from among the herds of his patrons and had influenced them, with the aid of the Babcock test, to get rid of the poor ones, and to take more interest in and better care of those remaining.

This should be one of the characteristics of every growing buttermaker. He should look, not to see how little, but how much he can do to advance the interests of his patrons. To this class of men only a word or suggestion is necessary. They do not stop with the mere knowledge of testing gained either from the man from whom they learn the trade, or from the ideas gained at the dairy school, but are hungry for more information, and are building on what they have learned and gained in careful practice. To them it is not necessary to say, "do every little detail carefully;" this is one of the principles inbred in a successful man or in a successful buttermaker, if you please. This is one of the things which has made him successful. The check to our advancement comes when we lose interest. As soon as we lose interest in a thing we fail to reach out after further information pertaining to this certain line and neglect to use our minds in connection with the details of the work, and it becomes only mechanical. For this reason it follows that even a good man may have his thought so directed in a certain line that his mind is not working with him in the little details about the test, but is off in search of food for thought along the lines of desirable flavors, and no doubt he has in mind just how that last starter smelled or tasted. To do good work we should keep up a deep interest in every branch of the work. While we are at testing let us gather a few interesting things about testing. Let us ask our minds to accompany us through the simple operations and we will promise in return something of interest at each step. With new interest new truths are uncovered.

A TENNESSEE DAIRY HERD.
Property of D. C. Young, Sweetwater, Tenn.

We should say as we start our testing, "Well, I do not wish to have our average test lower than our neighbor's because I may be using a pipette which delivers too small a quantity of milk." "I will measure out 17.6 c. c. of mercury in my burette and prove my pipette, and in the future I will be sure what I am doing so long as this pipette lasts." We should say: "Now, these test bottles were supposed to have been correct when they left the factory, but I wish to be absolutely fair and do not wish to give Friend Jones any better test because he is my friend, than I give Brown." There is a plunger made for the purpose of testing bottles and by taking a pipette small enough to slip inside of the neck of the bottle you can run water into the bottle, filling it to the zero mark without getting any water on the side of the neck to interfere with the reading. When the first section of the plunger is inserted into the water it should raise it to the "5" mark. The second section should cause the water to stand at "10." If we have no plunger we can use a 2 c. c. pipette, fill it with mercury to the mark indicating the above named amount and run the mercury from one bottle into another. This can be done nicely before the bottles are used, because there will be no water to interfere. When the mercury is in the bottle, we are careful to fit a tight cork into the neck, inserting it as far as the "10" mark, then inverting the bottle we find, if the bottle is correct, that the 2 c. c. of mercury has just filled the graduated space in the neck.

We then reason: "This is new acid, and while we suppose it is of the proper strength we might easily spoil out test unless we know it to be correct. Our creamery is liberal in getting things with which to work and we have a small hydrometer for testing the specific gravity of the acid. If we find it too strong, that reading is 1.83 when it should be 1.82, we will either have to set the acid and samples in the refrigerator, add a little water to the acid, take a little less, or we might leave the cork out of the acid bottle for a time and as the acid has great affinity for water it will soon take enough out of the air to dilute the acid.

If we have no hydrometer we might use the little scales, the board furnish for weighing samples of cream. If we are careful to balance two glass measures on the scales we can measure out 100 c. c. of condensed water from the steam pipe and measure out 100 c. c. of acid in the other glass, and as the acid is nearly twice as heavy as distilled water, if it is of the proper strength, it will take 82 grams on the water side to balance the acid. If milk is compared in place of the acid it should take three grams and a fraction to balance the milk.

With all these little things at your fingers' ends where you can use them, you can make it so clear to your patron that you are strictly up-to-date in your methods and competent, that he will not be led to wonder if he gets his proper test.

Take care in shaking up your composite sample each day that the cream is not slopped all over the inside of the bottle, set your sample bottles into hot water to melt what little fat you have stuck to the inside of the bottle.

Show your patrons, if they come in while you are testing, that you can run the milk down to the mark on the pipette quickly, but exactly, not by attempting to remove your finger a little from the end of the pipette to let in the air, but by merely twisting the stem a little between the thumb and fingers, letting out the milk drop by drop.

Tell them why it is necessary to weigh out 18 grams of cream on a small pair of scales when the cream tests over 25 per cent, instead of measuring with an 18 c.c. pipette. When their attention is called to it they will see that the heavier or thicker the cream the more it will stick to the inside of the pipette. They will see that the only accurate way is to weigh the cream samples and will not hesitate to purchase a small pair of scales.

If you have a lactometer, show them the difference in the specific gravity of skim milk and whole milk, and then show them how the lactometer will sink to the bottom of the glass in a sample of cream and tell them that the buoyancy corresponds with the weight of the liquids. If you should have a patron with good cows who thinks the test only a matter of guess, and complains because he has a low test, show him that you can, by applying your rules, lactometer and test, easily tell how much water has been put in a given sample. If the coat fits he will doubtless put it on.

If your over-run is not as large as it should be, according to the estimation of the board, and it is because you are making a dry butter, you can easily show this to their satisfaction by weighing out 4.5 grams of butter into a cream bottle, add three-fourths of a measure of water, and multiplying the reading by 4, thus showing the fat is in the butter, you can convince them. If they are good thinkers and are watching you, wondering why in practice you use as much acid for testing cream, when there is not as much casein, and reason would say you should not use as much, you can easily explain it to them by showing them you use a little water in rinsing out the pipette, and that if you weigh out the cream, you actually use less acid because the cream is weighed directly into the bottle and no water used in rinsing to combine with the acid.

All these points will be of interest to them, they will see that you are posted, they will be also pleased to know that it is not merely a form, but that you actually determine, when you attempt it, just what is in the milk. It will not then be necessary at the weigh can to tell them that you know what you are about. They will have learned the fact in a much pleasanter way. You will also have gained more interest, and new points will have been brought out.

Questions and Answers.

Hoard's Dairyman:—Enclosed find my renewal subscription for coming year. I take a number of papers, but Hoard's Dairyman is the one I depend on.

I am thinking of buying a gasoline engine. I have increased my number of cows, keeping now nearly 50. When I commenced reading the Dairyman three years ago, I had about 15 cows, and looked after them as most of my neighbors do now, which didn't mean very close or intelligent care, but Hoard's Dairyman got me to buy a registered bull and put up a silo, build larger barn, and last fall bought a separator. My tread-power used to fill my wants, but I have got to have better power. Which gasoline engine is the best? There are several advertised in the Dairyman.

I wish you success in your grand work. I am going to get you a few subscribers among my neighbors. They need its counsel bad enough and some of them will appreciate it too. J. S. M.
Illinois.

We would really like to help J. S. M. on his gasoline engine purchase, but in fact know too little as to the comparative merits of the different machines advertised, to justify an opinion as to which would be the best for him to purchase. It is with these engines, as with most machinery, impossible for any one person to know all there is to be known about the different makes and styles. We may have had personal experience with a certain engine or separator or other machines and found it satisfactory, but it would be consummate arrogance to consider this little experience sufficient foundation for a statement that it was better than others we had not tried. Moreover, it often happens that a machine giving good satisfaction to one man fails to meet the expectations of some other men.

Our personal experience with farm machinery and implements is no different or greater than that of many other dairymen, and for the reason that we know so little about the relative merits of the many different kinds of machines, we not only hesitate to advise, but in fact must beg to be excused from expressing opinions. The best advice we can give is to write to those parties who advertise in Hoard's Dairyman. Get their circulars and printed matter and read up and compare their relative claims. It will be found probable, that in some respects, one engine or other machine, will commend itself to one intending purchaser and some other machine, only slightly different perhaps, will be preferred by some other intending purchaser. The advertisements of a number of the leading gasoline engines on the market will be found in our columns.

This answer to J. S. M. may be taken as a general answer to the many similar inquiries we are receiving from time to time. Our advertising columns represent the leading and most reliable manufacturers in every line of machinery wanted by the dairy farmer. It is not to be expected that every individual reader will want all that is advertised, any more than he would think it practicable or practical to buy everything seen in a dry goods or grocery store, but our advertising columns should certainly be helpful in enabling our readers to find what they want, and introduce them to the best people to do business with.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

ALMOST every square foot of grass land in Wisconsin is covered this summer with white clover. Land that has not shown a white clover blossom for years is showing as thick a crop as if it had been sown this spring. Nature is using abundant rains to grow a dormant crop, and the farmer is getting the advantage of it. The present growth of white clover means increased fertilify to every foot of land where the white blossoms are found, and the results will be evident for several years.

MR. HARDIN, of the *Jersey Bulletin*, has discovered a Daniel in the person of Prof. Wing who walked in the Holstein lion's den and choked him until he reconsidered the impropriety of a 25% overrun. Mr. Hardin carefully ignores another Daniel-like judgment of Prof. Wing, which is as follows:

"It is just as misleading to the public to "figure in" excessive water by means of a too large conversion factor, *as it is actually to leave the superfluous water in the butter and weigh it and call it butter.*"

The above was written concerning records in general, but perhaps Prof. Wing is a "Daniel" only when Holstein methods are criticised.

Ripe hay is poor stuff, not worth the cutting, yet many men consider only the weight obtained, regardless of the amount of nutrients it contains.

There is little profit in feeding sawdust to a cow, whether it comes from a saw mill or a field full of ripe grass, but because the hay does not show its poverty as a milk producer, many men keep on feeding the cow a good, big ration of cellulose and then wonder that there are no returns in the milk pail.

An experiment at the Maine Experiment Station with timothy illustrates the value of early cut hay. For this experiment two acres as nearly alike in amount and condition of standing grass as possible were selected. One was cut in early bloom and the other ten days after bloom. The hay was stored under like conditions, and on Nov. 28 was reweighed and analyzed. There was a difference of 65 pounds in the weight of the dry hay in favor of the early cutting, but when we come to the digestible nutrients per acre and to the percentage composition of the hay we find a very marked difference. The percentages of digestible nutrients were: Protein, 4.89; carbohydrates, 48.73, and fat, 2.08, in the early cut, as against 3.29 per cent of protein, 45.30 of carbohydrates and 1.70 of fat in the late cut hay. This was an increase in digestible nutrients in the early cut over the late cut hay of 63.46 per cent of protein, 24.08 per cent of fat and 12.26 per cent of carbohydrates. It will also be noticed from the above that the greatest increase is in the protein, or most valuable portion.

THE SAME OLD SONG.

The editors of HOARD'S DAIRYMAN obtain a clear view of the real state of dairy intelligence in a great many communities in these United States. In these communities will be one or more of the most enterprising and progressive farmers. They are very apt to be subscribers of the DAIRYMAN. The paper has done them good, and they desire their neighbors to receive the same benefit. So they start out, and many times return discouraged.

Here is an example: Mr. James Mc Inerny, of Buskirk, N. Y., writes: "I am trying to get up a club for the DAIRYMAN. Some don't have time to read; others say 'book farming don't pay.' They still sing the old song."

Mr. Inerny finds, as all other men find, that it is the man who can't make his own way of farming pay, who is the most prejudiced against dairy papers and books, who talks the loudest. "Book farming don't pay." They have grown so rich at their mode of farming, they don't need to read.

SELECTING A BULL.

On this important question F. W. Hodson well says:

Experienced men are able to select good cows with a reasonable amount of certainty, but the most expert dairy judge is largely at sea when he attempts to select a good bull by appearances alone. When we come to the question of raising good cows, we find that the only road to success is in breeding from cows of known capacity and from bulls whose female ancestors have also been tested for merit at the pail and churn It is almost imperative that a good bull should be backed by a considerable number of good producing dams and granddams, if satisfactory results are to be expected from his daughters.

We wonder sometimes if breeders of dairy cattle ever study the score card of the American Guernsey Cattle Club which was adopted by that organization three years ago. In this scale of points will be found, for the first time in history, an attempt to bring this problem of judging a dairy bull down to settled principles.

It is by no means a perfect attempt nor one that subsequent experience may not modify, but it covers new and important ground, nevertheless. We advise every reader of the DAIRYMAN to write the Secretary of the club, Mr. W. H. Caldwell, Peterboro, N. H. for a copy of this scale.

ABOUT DAIRY CATTLE.

We wish every dairy farmer in the land could possess and read the Year Book of United States Department of Agriculture for 1902. On page 145 is a chapter devoted to "Dairying at Home and Abroad" written by Maj. Henry E. Alvord, Chief of Dairy Division. Maj. Alvord spent a number of months in the summer of 1901 in investigating the dairy conditions and practices of the leading dairy sections of Europe. His conclusions are based on a sound practical knowledge of the best practice in America and he draws some very instructive judgments from what he saw and studied. On the question of dairy cattle he says:

"Dairy cattle constitute the foundation, and all important factor of the industry." How does this comport with the ideas of thousands of dairy farmers in the United States who think that beef blood, dual-purpose blood, any and all sorts of blood, is good enough with them for a "foundation." He further says:

"We have no dairy cattle of our own in America; we have adopted those orignated in and brought from other countries. Even our "native" or "common" stock or "scrubs" are but mongrels of another continent. It is impossible to estimate the debt of the dairy farmers of this country to the breeders of Ayrshires and Guernseys and Holstein-Friesians and Jerseys in their native lands. These are the four races of cattle *upon which mainly rest the present and future prosperity and progress of dairying* in America."

Those are strong words, yet we cordially believe them to be true. If true, what sort of work is any dairy farmer doing for himself or his country who breeds beef blood into his herd? Does he see the future as it should be seen?

SOMETHING WORTH READING AND REFLECTING UPON.

The editors of HOARD'S DAIRYMAN believe they are doing a much needed work among the farmers who keep cows. They believe—nay more, they know—that the tone or sentiment existing among those farmers concerning what they should do as dairymen is too low, to bring good profit. We will say nothing about any other consideration but actual profit. No man can make the money with cows, he ought to make, and look and act towards his business as the great mass of dairy farmers do look and act.

There is such a lack of intelligence; so little real thought or study; so little brain work, that of necessity the standard is a low, unprofitable one. Yet these dairy farmers do not see it. Take those 80 men in the Creamery Patron Investigation in Onondaga Co., N. Y., which has been running through the columns of the DAIRYMAN.

Mr. Jenkins has visited each one of those farmers; he has investigated the actual conditions in which they carry on their work; what their cows are, what they cost for keeping, what their earnings were at the creamery, and last how much intelligence each man put into his work. Think of the idea of 80 men who profess to be dairymen, and not one in ten having real interest enough in his business to read dairy literature, or try to keep his mind intelligent on this important question. Is there any cash value to such reading and study? Here is a bit of testimony on the question:

Mr. M. E. Bemis, manager of the Scottdale Dairy and Stock Farm of Scottdale, Ga., writes us the following testimony of the value to him of thorough reading and study in this line of work. He says:

"Much of my success in securing my present position is due to a careful study, for several years, of HOARD'S DAIRYMAN. I came south from Vermont about a year and a half ago. In my first position which I came to fill, I was unfortunate. The man in charge, in 16 months that he had managed the farm, had 5 men besides myself. None of them were any good, and all of us were forced to quit without a record. I came here and began work as an ordinary hand. In less than 7 months I have been gradually promoted to a position of business manager of one of the best dairies in the south. I don't say this to brag, but to show that a young man with a good knowledge of the dairy business, has a good chance to succeed, and for this knowledge I am largely indebted to the DAIRYMAN. You have my best wishes."

Compare the results of Mr. Bemis' work, what came of his attention to the best thought and best knowledge he could get, and its final effect on his fortunes, with the effect of the no-read, no-think, no-study policy so many dairymen believe is the heighth of wisdom. This principle of intelligence applies everywhere on the dairy farm. It tells in the owner; it tells in the hired man. It is often the saving clause. Take the last ten farmers of the Onondaga Investigation that Mr. Jenkins reports. Here they are:

The amount received for $1.00 invested in feed is as follows:

No. 71	$ .81
No. 72	1.10
No. 73	1.36
No. 74	.49
No. 75	.79
No. 76	.48
No. 77	1.05
No. 78	.99
No. 79	.76
No. 80	.99

No. 76 lost 52 cents on every dollar he had invested in feed. No. 71 lost 19 cents; No. 75 lost 31 cents; No. 74, 51 cents; No. 78 lost 2 cents; No. 79, 24 cents; No. 80 lost one cent.

There is the story boiled down to the mental condition of the men who are behind the cows. Could anything bring out with sharper distinctness the truth that if farmers will not read and study and strive to make themselves intelligent workers in this dairy business, they will inevitably bring punishment upon themselves?

THE FARM SCHOOL AND FARMER THAT IT HAS PRODUCED.

Every means, every agency, every thing that is at work moulding the thought, shaping the judgment, and affecting the fortune of the American farmer is of the greatest interest to HOARD'S DAIRYMAN. For this reason we have labored for years to arouse the farmers of this country to a sense of the importance of doing more than they are doing to improve their minds, to increase their mental grasp on the serious problems that confront them in farming. Their hands are strong enough; no complaint about their industry, for they work more hours than any other class of men. The trouble is not there. But there is trouble, weakness, and serious failure in another direction, and that is in their lack of desire to know what they ought to know.

We speak of the farmers of the United States as a class. Here and there, scattered through them are men who have a strong desire to be well posted, up-to-date farmers. These men realize the great assistance it is to have a well stored mind. They take time and pains, and spend money for sound information, just as intelligent men in other vocations do.

Our readers know that we have spoken often on the unsatisfactory conditions in the country school. We have been trying to rouse the farmers and teachers to a sense of their duty in this matter, for we can see what this poor country school meant for the farmer that now is. We can see what the right kind of a school will mean to the farmer that is to be, and we can see what it will also mean to the future prosperity of the country.

An eastern friend, who is both an educator and farmer, writes us thus:

"I have read with great interest your repeated editorials, urging the farmers to do more reading, and thus obtain a better, broader understanding of what can be and should be learned concerning this great proposition we call farming.

"No man on earth needs the help that intelligent reading will bring him, as does the average farmer. His boys, if they are to be any better farmers than their father, need to come up in a reading home; need to know what the farm books and papers are talking about. Still further, the state and the nation require that the farmer shall be a reading man in order to stop this fearful waste of fertility that is going on, all over the land.

But you and I will never see the farmer what he should be in the scale with other men, until the country district school is differently organized from what it now is. The farmer is just on a par with the school he was educated in. Elevate that and you will elevate the farmer to the place he belongs."

How true are the above words, and how few are the farmers who realize their truth.

The farmer gets his schooling in the

country school. It is the poorest school in the land. Besides this, the average farmer has little or no ambition to make his district school any better than it is. He ought to know by this time, with all his experience, that the old Bible is right when it says: "As ye sow so shall ye reap."

What kind of sowing has been going on in the country school all these years? The farmer is just what his father was before him. The same poor school and half educated teachers did the work for them. The same poor school with no improvement for fifty years, is doing the same wretched work for the farm boy of 1903. Not a word is taught that will help him comprehend and make use of the information he needs, in agricultural books and papers. What is said there concerning the science of the farm, is all Greek to him. It was Greek to his father. The law student cannot understand the meaning of law unless he learns the meaning of the law terms. The farmer would despise a lawer who could not understand the meaning of what he reads in law books, and so he would despise the doctor or surveyor, or the preacher, or the mechanic, who did not keep thoroughly posted in the literature of his own profession. He expects them to be intelligent. He expects them to understand what they read. He expects that they will go to school—a good school—and become educated in the business they are to follow.

But the farmers of the United States go to the ground at once when it comes to considering their own schools, the country district school. They evidently want them to be poor and cheap, and to carry out that idea they hire the poorest, cheapest of teachers and shut out every study that will help the farm boy to understand the meaning of what science has to give to aid him in farming.

Just so the farmer was educated, and just so is he educating nearly every boy that is to be the farmer of the future.

If the farmer of today understands the meaning of agricultural literature, he has obtained that knowledge by a hard struggle, without any assistance from the school of his youth. Not an hour of teaching was ever given to him to help him understand the meaning of the terms used in agricultural chemistry. Yet agricultural chemistry is the foundation of all science in farming. And so the procession moves on from father to son. All the outside world except the farmer is being helped along by education. Note how the villages and cities tax themselves for their schools. Note how grudgingly money is raised in the country districts to help the country school. Note how many farmers despise what they call "book farming." Note how many are rearing their boys in the same contempt for knowledge. The farmers pay more money in taxes to educate doctors and lawyers than they do to educate their own sons in the great study of agriculture. Surely, the country district school is the place to start the great work of making the American farmer what he should be, as an enlightened citizen and farmer.

Criticisms on Butter in the Fourth (June) Test for the Current Year.

E. SUDENDORF, Secretary National Creamery Buttermakers' Association, Elgin, Illinois.

DEAR SIR:—You perhaps will be interested, and the buttermakers pleased, to know that the butter at the fourth test was, perhaps, the best of any since the inauguration of the six months' tests last year.

I asked W. D. Collyer, the judge, after the scoring was completed, how, in his opinion, the last butter compared with that of previous tests. His reply was: "The workmanship was better than at any test the last two years; there was less slushy, over-worked, off-colored butter, and on an average was a very good lot, and it was more satisfaction to score such goods than those of inferior quality."

This is pretty late to tell how the scoring is being conducted, but inasmuch as a buttermaker asked me recently, if the judges did not score the butter made without a starter lower than the rest, and as on an average I believe that is true, I may explain that the scorer does not know how the butter is made, whether pasteurized, from whole milk, gathered cream, or whether or not a starter was used. All the judge has is a blank score card and a trier filled with butter. From this sample the butter is scored, the results written on the score sheet, and then the number of the tub is also written on the score sheet, and the tub is passed on. The buttermaker's method slip is found by number, the name on which has been torn off by the secretary before the slips are turned over to any one else. The butter is then again examined, and the criticisms made. The judge knows nothing about the kind of butter, where it came from, or to whom it belongs. He does not know when a trier is handed him whether it is butter or oleomargarine.

DEFECTS.

Certain defects are more prominent in butter one month than another. During some of the winter months, the causes of poor butter are entirely different from those found at present. One defect heretofore classed with many others as poor milk, a fatty flavor, different from that commonly called oily, was quite pronounced in a good deal of this butter. This peculiar flavor is due to the melted butter fat, caused by the sun striking the cans, and it can easily be detected after inspecting milk at the creameries, which is brought in cans unprotected from the sun, and possibly a short exposure on the sunny side of the factory. I have also noted the absence of this flavor at creameries where patrons had the cans covered with canvas or blankets, or observed the presence of it on loads, when some of the cans were not covered. The remedy for this, of course, is to have the patrons cover the cans. This one thing was the cause of a good many scoring a point or two lower than they would have without this fatty flavor. Those who will find the criticism "fatty" on their score sheets will know what it means.

WEEDY FLAVOR.

Weedy flavor was in evidence in many tubs, and some of the flavors called weedy may simply have been from lowland pastures, and not weeds at all, but all the butter that had such flavor was classed as weedy.

OILY.

Very little butter had an oily flavor; less of that flavor is found in summer than in winter. I may have more to say about this flavor at some future time, but would advise buttermakers not to put in a large supply of color, and what they have on hand should be corked well and kept in a cool place, but not allowed to freeze.

FEVERISH.

There was also less of the feverish flavor than at the May test. In an article about one year ago, I said that flavor possibly was caused by the feverish condition of the cows, which I still believe is true in some instances, but I have also traced the same flavor to milk from cows too soon after calving.

OLD MILK.

Old milk flavor is found at every test, and about the only thing possible that can be said on that subject is to tell the buttermakers to do the best they can to get the milk every day. Pasteurization will partly overcome that flavor.

STARTERS.

Off flavored and over-ripe starters were less in evidence than at former tests and the makers are doing good work with starters, and should make that subject a study.

CURDY.

Curdy flavor cannot be traced to any one cause, and there was considerable of it at the last test, but it may be well to caution the buttermakers not to use a large amount of starter, say 20 to 25 per cent, or if they do use a large amount it is necessary to stay by the cream and keep it stirred. High ripening temperatures, over-ripe and large amount of starter seem to have something to do with curdy flavor.

PASTEURIZED CREAM BUTTER.

The pasteurized cream butter, on an average, was of better quality than usual, and many of the best buttermakers would make a better article of butter if they had pasteurized cream to work with, and that system is growing in favor more every day.

HIGH SALT.

Some of the buttermakers evidently tried to cover up a bad flavor by adding salt, which I believe is a mistaken idea, unless the flavor is very bad; but in several cases at this test, the butter would have scored higher had it not been so highly salted. Some of the salt seemed to impart a stale, bitter flavor, perhaps not due to the salt, but due to the taints the salt took up by being stored in a place where taints existed. I may also add that some creamery companies, for the difference of five to ten cents a barrel, buy enough salt to last two or three years, when enough to last six months would be more sensible.

SOFT BUTTER.

Some of the butter reached Chicago in a heated condition, and was largely the fault of the shipper not packing it properly. When butter is shipped by express, any distance, the twenty pound tub should be wrapped with several thicknesses of paper and then put into a 60 pound tub, which should first be partly filled with paper, and the space between the 20 and 60 pound tub should be filled with paper, and a good supply put on top of the small tub. Any tub will do if it is dry and clean. I should also advise those who send butter to Sioux Falls, to pack their butter in the same way. Some care should be taken to use good paper. I have seen some common, brown paper used, which became wet, perhaps from the large tub, and the odor penetrated the butter, which scored low.

It would be a satisfaction to all concerned, if the next two lots would show as much improvement as the last one.

Tests not Satisfactory.

I have two Iowa patrons; their tests in Iowa did not go under 5 per cent. I have seen the reports myself. The same cows brought to Barron Co., Wis,, last year, tested only 3.8 to 4.1. One of those patrons told me they are not satisfied with that test, although he was here when testing was done. He told me that he weighed 50 pounds of milk, and made 2¼ pounds butter. So let me know in next paper how much butter can he make out of that test, 3.8 to 4.1 per cent. I am very sure my test is right It is a hand tester. I always test two bottles to find how much acid it stands, so it makes clear test. M. J. W.

Tuscobia, Wis.

In order to make two and one-half pounds of standard, commercial butter from fifty pounds of milk, it will be necessary that the milk should test not less than 4 4 per cent fat. Of course it would be quite possible to make this amount of butter from fifty pounds of milk testing less, if more water was incorporated in the butter, but it would not be first-class butter.

The only thing you can do with these dissatisfied patrons is to assure them, as you seem to have done, that your test is correct, that they are getting all the fat there is in the milk, and that it is frequently the case that cows sometimes fall down wonderfully in their test on change of location. It is all right to do what one can to satisfy patrons, but patrons are sometimes so unreasonable in their statements and demands that about all that can be done is to say to them: "If not satisfied, keep your milk at home or take it somewhere else."

A Recipe for Pork Pickle Wanted.

Can you or any of your readers furnish a prescription for curing or pickling pork for home consumption that will guarantee its keeping 6 months or more in a southern climate, where the temperature necessitates the meat being put in pickle within 24 hours after killing.

Jamaica, W. I. A DOWN SOUTH DAIRYMAN.

If any of our Southern readers can furnish the information sought in the above inquiry, we shall be very glad to receive and publish it, not only for the benefit of this reader, but for others similarly circumstanced. So far as we are personally concerned, the only method for pickling pork that we are acquainted with is to pack it securely in salt, being sure to use more salt than can possibly be dissolved in the pickle. After the pork has been in this saturated brine a few days, or possibly, a few weeks, we would take it up, wash it thoroughly, scald the brine, which by this time has drawn more or less matter of one kind and another from the meat, and then repack it. When the pork has become thoroughly cured in the salt, we expect it will be necessary, in the southern climate, to take it up and smoke it thoroughly.

Feeding Value of Wheat.—Best Breed.—Hard Milkers.

I subscribed for your valuable paper through Mr. Haskins, and received my first copy dated June 26th and wish to ask a few questions; as the business is new to me I want all the information that I can get. Is whole wheat (ground) a good ration for milk cows? If so, when bran is $18 per ton and wheat from 50 to 60 cents per bushel, will it pay to sell the wheat and buy bran, or will it pay to buy wheat instead of bran, or what is the relative feeding value of 100 lbs. of bran and 100 lbs. wheat (ground?)

Which is the most profitable breed of dairy cows? I mean as a breed, the Jerseys, Guernseys or the Holsteins? Is the Red Poll a good dairy breed? I have a cow that is very hard to milk. Would you recommend those rubber teat dilators, or teat openers? Are they a success? T. H.

Medford, Okla.

Ground wheat of itself does not make a very satisfactory feed for cows, as they have great difficulty in eating it, because when mixed with the saliva, it makes a thick, sticky paste. It is therefore necessary when using whole wheat to mix it with bran or some other product to overcome this pastiness, to a greater or less degree. It might be fed with cut straw or hay and in this combination would make an excellent complement to alfalfa hay. Wheat contains about 83 per cent of digestible nutrients, whereas bran contains only 58 per cent.

If the best and most profitable breed of dairy cows could be satisfactorily determined, there would be but one breed, but opinions differ so widely in this respect, that it must be considered, not simply an open question, but an indeterminable question. This is very fortunate as it enables one to consult his own preferences and whims. One man may prefer Jerseys, his next neighbor, for reasons satisfactory to himself, dislikes Jerseys and pins his faith to Holsteins, while a third man in the same neighborhood, disliking both Jerseys and Holsteins, will have nothing but Guernseys. Red Polls are not accounted a distinctively dairy breed of cows. There are many good and profitable milkers among them, but breeders of this stock recommend them as the ideal dual-purpose farm cow.

The hard milking cow is a serious problem. Sometimes these teat dilators answer a very good purpose. At other times, it is recommended to sever the muscle at the end of the teat with a sharp knife. Unless the cow is especially profitable, the best treatment we know of is to sell her to the butcher.

Amount Skim Milk and Whey.

1. What is the amount and feed value of the skim milk that a patron should receive from 100 lbs. of whole milk delivered to a creamery?

2. What is the amount and feed value of the whey from 100 lbs. milk that a patron should receive from a factory making Italian cheese?

Penn. J. E. A.

This inquiry was accompanied with an addressed, stamped envelope, evidently upon the theory that we would answer by mail. This is contrary to our rules, not only because we have not the time to answer communications by personal letter, but for the further and very good reason that we have nothing to say on these subjects that cannot be said in print where it can be read and known of all men.

The amount of skim milk that a patron should receive from 100 pounds of whole milk delivered to a creamery will depend somewhat upon the way the separator is run, or the amount of fat in the cream. It used to be the practice to return about 80 pounds of skim milk for 100 pounds of whole milk. In later times, creameries are unsually running a thicker cream and there would be perhaps a little more skim milk.

It is as impossible to determine the feeding value of skim milk, as it is to determine the feeding value of corn or oats. This value will vary with the price of other feed stuffs and especially with the skill and care of the feeder in using it. It is quite easy to make skim milk return a value of 25 cents for each 100 pounds, when fed to growing pigs or calves. It is equally easy to so handle skim milk that it will not return more than 10 cents per hundred pounds.

Inasmuch as 100 pounds of milk is expected to average nearly or quite 10 pounds of cheese, there should result about 90 pounds of whey and whey is estimated to be worth from 5 to 7 cents per hundred pounds.

Raising Fodder Corn.

A Difference of Opinion.

ED. HOARD'S DAIRYMAN:—In the DAIRYMAN of June 26 on page 476 you give an article on Raising Fodder Corn by Professor Haecker of the Minnesota Experiment Station. After reading that article I said, is the Professor authority on that subject? If so then I am clear way off, for he says plant the corn thick so as to prevent the forming of ears, for it is better for the nourishment to remain in the stalk than to go into the ear. In other words he don't want any ears to form on the stalks at all. No sir! I hold that no stalk is worth anything for fodder in green state at all, unless it has formed an ear and partly grown said ear. Now let me tell you how I came to this conclusion.

Some little time ago I drilled a piece of corn next to my lane for the purpose of using it for fodder for my cows when the grass became short. That corn grew splendid. Some of it was 8 ft. high and on down to 4 ft. Well, the grass became short and I began to feed this corn after it had tasseled out but no ears on the stalks at all. For the first feed or two they ate them all up nice and clean, but soon I found some of the butts of those stalks left and soon the lane became covered with the stalks.

I said, what is the matter? I guess I had better change my feeding place, and so I took the stalks up to the stable and fed them in the mangers, but the result was no better. The cows would eat the leaves and the top of the stalks but would leave the butts, and again I said, what is the matter? Then I thought I would try an experiment and so I wheeled up a feed or two of corn that had been grown in the hill. These were large stalks, some two inches through, with large ears on from eight inches to a foot long. I picked off some of the largest of the ears for the pigs but the result was, the cows ate up those stalks from end to end and looked around for more.

And again I asked myself, what is the matter now? And so I thought I would try an experiment with my own mouth, and so I went and cut one of these typical stalks that had not formed an ear, and cut out portions of it, prepared it and ate it myself, and I soon found out that this stalk was rank bitter, and there was not the least good taste in the stalk.

Then I went and cut one of the largest stalks with the largest ear on and prepared that in the same way and ate that, and I found that sweet and pleasant to the taste, and I was not long in deciding what was the matter, and so firm has become that decision that I don't want any stalks to feed my cows for green fodder, than those stalks that have ears on, and since I have adopted this plan of preparing my fodder corn, I have had no trouble with the cows wasting the butts of the stalks.

In fact, I find in Experiment Station Bulletin No. 11, on page 56, that the butts of the stalks have 3.49 protein and the middle has 2.71 protein and the top has only 1.88 protein. So, as far as the butt is concerned, it is the most valuable part of the stalk, which my cows were leaving with those stalks that had not formed ears. And so surely have I become convinced by this, and other like experiments, that if any one would put the fodder corn in for me, in the way first spoken of, free of expense to me, I would say no. W. B. J.

Salem, Mich.

The Canadian Butter Bill.

Manufacture of Renovated Butter Prohibited—First Reading of Bill—Peculiar Definitions—Excess of 16% Water Deemed an Adulteration.

Canada is starting on the right road in looking after the purity of her dairy products. By so doing, she will be saved from the costly mistakes of permitting the manufacture of oleomargarine, filled cheese, etc. Following is the proposed new law regarding dairy products:

1. This Act may be cited as The Butter Act, 1903.

2. This Act shall come into operation on the first day of July, nineteen hundred and three.

3. In this Act unless the context otherwise requires—,

(*a.*) "Creamery" means a place where the milk or cream of not less than fifty cows is manufactured into butter;

(*b.*) "Dairy" means a place where milk or cream of less than fifty cows is manufactured into butter;

(*c.*) "Butter" means the food product commonly known as butter, which is manufactured exclusively from milk or cream or both, with or without the addition of coloring matter, common salt, or other harmless preservative;

(*d.*) "Creamery Butter" means butter which is manufactured in a creamery.

(*e.*) "Dairy Butter" means butter which is manufactured in a dairy.

(*f.*) "Renovated Butter" or "Process Butter" means any butter which has been melted, clarified or refined, and made to resemble butter.

4. Any butter which contains over sixteen per cent of water shall be considered adulterated within the meaning of this Act.

5. No person shall mix with butter any acid, alkali, chemical or any substance whatever, which is introduced or used for the purpose or with the effect of causing the butter to absorb water or any part of milk or cream.

6. No person shall manufacture, offer, sell, or have in his possession for sale, any oleomargarine, butterine, or other substitute for butter, manufactured wholly or in part from any fat other than that of milk or cream.

7. No person shall manufacture, offer, sell, expose, or have in his possession for sale, any renovated butter, process butter, adulterated butter or butter which has been treated in the manner described in section 5.

8. No person shall brand or mark the word "creamery," or any combination of words which includes the word "creamery," upon any box, package or wrapper containing butter, unless the butter contained in the box, package or wrapper consists wholly of creamery butter manufactured at one place.

9. No person shall sell or offer, expose or have in his possession for sale, any butter contained in any box, package or wrapper upon which the word "creamery," or any combination of words which includes the word "creamery," is branded or marked, unless the butter contained in the box, package or wrapper consists wholly of creamery butter manufactured at one place.

10. Every person who, by himself or through the agency of another person, violates any of the provisions of this Act, shall, for each offence, upon summary conviction, be liable to a fine not exceeding four hundred dollars, and not less than ten dollars, together with the costs of prosecution, and, in default of payment of such fine and costs, shall be liable to imprisonment, with or without

"ADVERTISEMENT."

SLOW STARVATION

The Dyspeptic's Diet Leaves no Chance for Regaining Strength.

The dyspeptic who starves body and brain because food will not digest has no chance to get strong again because bodily strength cannot be built up except on food that will digest.

That is the mission of Grape-Nuts which any dyspeptic can digest and which will begin to build up and nourish at once.

A Wisconsin man says: "For the last 7 years I have been a great sufferer with stomach trouble and for 18 months I could not eat or drink anything, not even a spoonful of milk, without great suffering.

"It seemed I had tried every remedy in the world and I had given up all hopes of ever getting better when a friend advised me to eat Grape-Nuts food. I was just about too much discouraged to do so for I expected to die and all my friends expected I would too but finally did send for a sample box and when it came I was so weak I could not turn over in bed.

"Then I began to take the Grape-Nuts, just a little bit at first, moistened with hot milk and from this time I began to grow stronger and before I had finished the fourth package I could eat and drink anything I wanted and it did not hurt me in the least. So the right food helped me to health after everything else had failed.

"Experience, actual use, proves absolutely the great power of the scientific food Grape-Nuts." Name given by Postum Co., Battle Creek, Mich.

THE U. S EXCELS ON ANY TEMPERATURE.

Our "would-be competitors" the DeLaval Separator Co., finding themselves badly beaten in the six weeks' tests of six different makes of Separators at the Kansas Agricultural College, as shown by the official Bulletin No. 123 issued May 26, 1903, in their efforts to break the force of so disastrous a defeat, have compiled a Bulletin of their own "getting up" purporting to be signed by several students, in which they try to make it appear that the DeLaval was not terribly beaten, as the Official Bulletin shows it was as follows:

Average test of skimmilk of DeLaval Separator	**.048**
" " " U. S. "	**.033**
U. S. excels DeLaval	**.015**

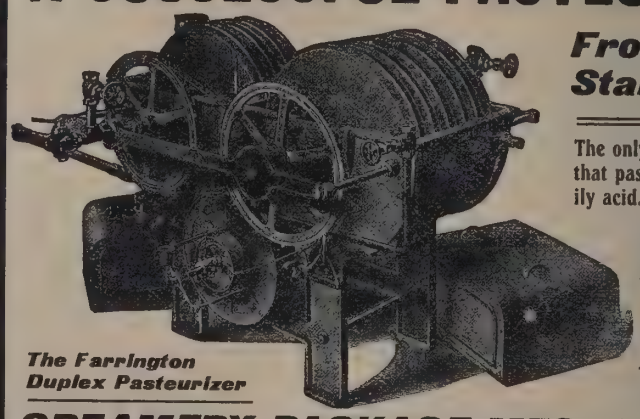
Showing that the DeLaval Separator left 45 per cent. more butter fat in the skimmed milk than the United States.

Again in this "gotten up" Bulletin, our "would-be competitors" state that the U. S. Separator "choked up" on 39 lbs. of milk at 70 degrees of temperature and that the DeLaval ran 80 lbs. Every dairyman using a U. S. Separator knows that the U. S. will not "choke up" on 80 lbs of good milk at 70 degrees, and that such statements are made in an attempt to break the rapidly gaining popularity of the

U. S. SEPARATOR.

We make the following proposition to any dairyman wishing to buy a separator, viz.: We will put a U. S. Separator into his dairy and agree that it will not "choke up" on 80 lbs. or twice 80 lbs. of milk in good condition at 70 degrees, provided he will pay for the separator if it does not "choke up."

The best authorities do not advocate separating at 70 degrees, but if Dairymen prefer to, the U. S. will do it when properly adjusted.



The U. S. Separator skims cleaner than any other separator on the market at any temperature from 70 degrees to 156 degrees at proper adjustment. The Official Bulletin No. 123 of Kansas Agricultural College, dated May 26, 1903, states that

The U. S. Excelled all Others in tests of Skimmed Milk and in Minimum Total Loss.

THE U. S. SEPARATOR HOLDS WORLD'S RECORD.

Hoard's Dairyman.

hard labour, for a term not exceeding three months, unless such fine and the costs of enforcing it are sooner paid.

11. Any person charged with the enforcement of this Act may enter any premises to make examination of stock or packages, and the marking thereof, whether such stock or packages are on the premises of the manufacturer or owner, or on other premises, or in the possession of a railway or steamship company; and any person who obstructs or refuses to permit the making of any such examination shall upon summary conviction, be liable to a penalty not exceeding five hundred dollars, and not less than twenty-five dollars, together with the cost of prosecution, and, in default of payment of such penalty and costs, shall be liable to imprisonment, with or without hard labour, for a term not exceeding six months, unless the said penalty and costs of enforcing it are sooner paid.

The last sections refer more to the enforcement of the law and provide that one-half of the fines recovered shall be payable to the informant or complainant.

In the discussion on the first reading, Dr. Reid, of Grenville, wanted to know how a farmer's wife was going to find out whether her butter contained a fraction over 16 per cent of water. She might find herself subject to heavy penalty and be entirely innocent of any wrong doing. To this the Minister answered that any person honestly trying to make good butter would have much less than 16 per cent of water in it. The instances where such a percentage of water was found, were, in his opinion, deliberate attempts to sell water for butter.

Mr. Boyd pointed out that of 105 samples of creamery butter examined at the experimental farm, the amount of water ran from 7 to 16 per cent. The great majority contained 12 or 13 per cent, and one sample made by experts, contained over 16 per cent.

Flooded Alfalfa.

In the regions covered by the recent disastrous floods was a large acreage of alfalfa that was covered with water for a greater or less length of time. Regarding the probable results of this flooding, Prof. A. M. TenEyck of the Kansas Experiment Station says:

On June 7, I drove five miles north of Manhattan through the flooded district in the valley of the Blue river. The waters had practically disappeared from the surface soil, but the ground was very wet and soft in most of the fields at that time. I believe that practically all crops which were covered by water three or four days, have been destroyed in this district. It is possible that alfalfa on well drained fields may revive. By careful examination of fields which were under water for four or five days I observed that new shoots were starting from the crowns of about 10 per cent of the plants. The old stems seemed dead and on the stems and leaves were more or less of a deposit of mud which gave the fields a very unfavorable appearance. I am advising disking of these fields as soon as the ground is dry enough. It may be necessary in many cases to cut the alfalfa before disking. This will be no small undertaking because of the deposit of mud and the lodged condition of the crop. I advise disking in order to break up the cemented close condition in which the surface soil will be left when the ground dries. The great need of the alfalfa roots is for air and perhaps if air is supplied soon enough the plants will survive, at least the disking will do no harm.

It does not seem to be a fact that alfalfa is always destroyed by being flooded with water for short periods of twenty-four to forty-eight hours as has been stated in some of our publications. I quote from Bulletin 66 of the Texas Experiment Station, which has just been issued: "Alfalfa is naturally opposed to wet soils, but where favorable soil conditions exist, well matured alfalfa has a wonderful power of recuperation. The destructive effect of the overflows is greater on the immediate river front land and in practically every instance where such lands were devoted to alfalfa the crops were killed out to an unprofitable stand. The heavy deposit of sediment on the plants, in some instances completely covering them, prevents the natural life functions of the plants.

Mr. O. J. Chance, who has a large acreage of alfalfa in the Brazos bottom, about two miles from the river, in speaking of the effect of the overflow, said: 'The overflow of last summer did not completely cover my crop, but remained on the land for the greater part of six days. It was running water. My alfalfa land is well drained except in spots. The crop was only slightly injured except in the low places, where the water stood for some time after the overflow water had receded. In such places it was killed out.'

Mr. Robert F. Smith, of the Smith & Carson Plantation, said, 'A large part of our alfalfa was under water for nearly eight days last summer, and being located near the river front, was covered with eight to ten inches of sediment. Almost four weeks later this land was prepared for fall oats. A good sprinkling of alfalfa came up with the oats, having survived the severe conditions to which it had been subjected. I believe that there is very little danger to alfalfa from overflows back from the river, say from one to two miles, except in poorly drained spots. A light rain following the receding of the overflow waters is a great help, as it washes the sediment off of the plants. The overflow of this winter did not injure my crop planted last fall, although it was on the land for two days and completely covered it for a part of that time.'

Mr. John Nabors said: 'If there is not too much sediment and it is running water, alfalfa will stand overflows of long duration, and especially so if the overflow is followed by light rains to clean off the sediment from the plants.'

The alfalfa on the Koppe plantation is located about one mile from the river. The overflow of last summer completely covered this field for at least five days—the fence-posts were almost entirely under water. The alfalfa only died in poorly drained spots and where scalded by the sun."

The water did not recede from the alfalfa lands in the part of the Blue Valley visited soon enough for the rains to wash the sediment from the plants. Yet taking into account that the alfalfa was practically matured and ready for cutting, I believe that if the fields can be cleared and disked before the ground bakes, much of the alfalfa on the Blue river bottom will be saved. This will doubtless hold true for other flooded districts.

HE HITS THE NAIL ON THE HEAD.

Prof. C. G. Hopkins, of the Illinois Agricultural College, put the fertility question in a sharp light when he recently said:

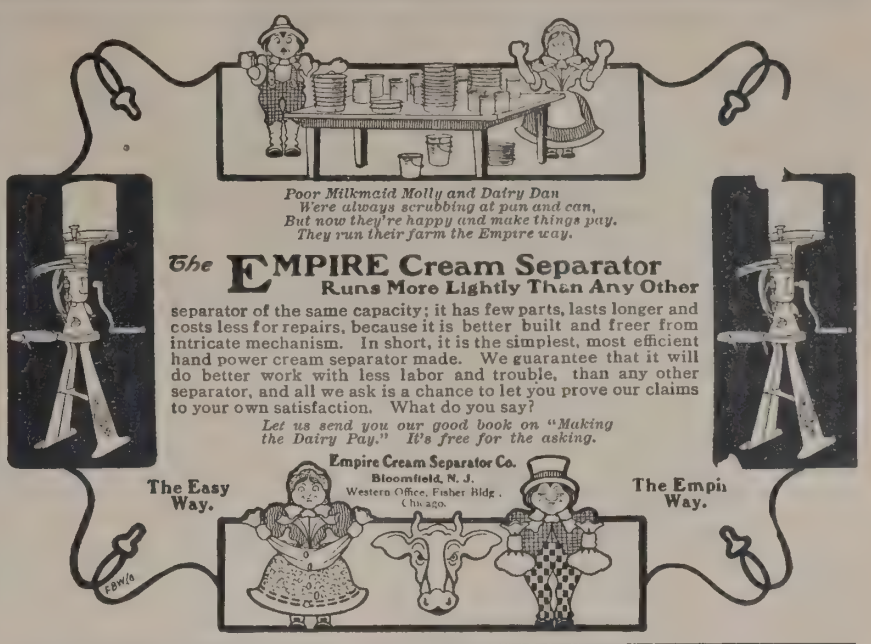
"The merchant buys and sells and buys again, but the farmer sells and sells until he is practically 'sold out.'"

"ADVERTISEMENT".

EXPERIMENTS

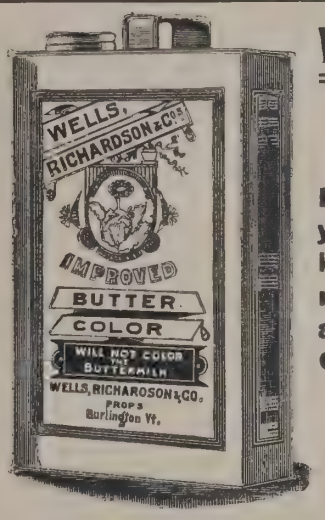
Learn Things of Value.

Where one has never made the experiment of leaving off coffee and drinking Postum it is still easy to learn all about it by reading the experiences of others.



Drinking Postum is a pleasant way to get back to health. A man of Lancaster, Pa., says: "My wife was a victim of nervousness and weak stomach and loss of appetite for years and was a physical wreck; although we resorted to numerous methods of relief one of which was a change from coffee to tea, it was all to no purpose.

"We knew coffee was causing the trouble but could not find anything to take its place and cure the diseases until we tried Postum Food Coffee. In two weeks' time after we quit coffee and used Postum almost all of her troubles had disappeared as if by magic. It was truly wonderful. Her nervousness was all gone, stomach trouble relieved, appetite improved and above all a night's rest was complete and refreshing.



"This sounds like an exaggeration, as it all happened so quickly, but we are prepared to prove it. Each day there is improvement for the better for the Postum is undoubtedly strengthening her and giving her rich red blood and renewed life and vitality. Every particle of this good work is due to Postum and to drinking Postum in place of coffee." Name given by Postum Co., Battle Creek, Mich.

Ice cold Postum with a dash of lemon is a delightfnl "cooler" for warm days.

Send for particulars by mail of extension of time on the $7,500.00 cooks contest for 735 money prizes.

THE KIND THAT HAS NO MUD.

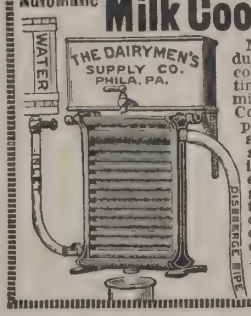
Wells, Richardson & Co.'s

Improved Butter Color

Has stood the test for many years, and users of color know that it can always be relied upon. It is the BEST and therefore the CHEAPEST COLOR on the market.

For Sale By All First-Class Supply Houses.

Creasey Ice Breakers



Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right.

Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.

MELONEY'S Automatic Milk Cooler and Aerator

TRADE MARK BESTOV

Made of the best conducting material—sheet copper and coated with tin outside where the milk comes in contact. Cools milk quickly. Expels all animal odors and the smell of grass and garlic. Aerates it thoroughly. Can be easily cleaned. Fully guaranteed. Used by the most progressive dairymen. Send for catalogue "Bestov" dairymen's supplies.

Dairymen's Supply Co., Dept. Philadelphia, Pa.

The Distribution of Skim Milk.....

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Points on Calf Food.

Experiments in Supplementing Skim Milk With Various Feeding Stuffs.

Bulletin No. 92, issued by the U. S. Department of Agriculture, contains an interesting section devoted to a report of calf feeding experiments as follows:

"The Iowa Station has conducted experiments extending over a number of years to learn what feeding stuffs may be profitably combined with skim milk for calves. In two of the tests, linseed meal, ground oats, and a mixture of corn meal and flaxseed were compared as supplements to separator skim milk. In the last test reported corn meal was also included. For this test (which covered 74 days) twelve calves were divided into four lots of three each. During the test each lot consumed about 3,760 lbs. of separator skim milk and 1,480 lbs. of hay. In addition, lot 1 was fed 429 lbs. of linseed meal; lot 2, 605 lbs. of oatmeal; lot 3 59 lbs. of flaxseed and 538 lbs. of corn meal, and lot 4, 601 lbs. of corn meal. The lots were kept in well-ventilated sheds with yards connecting. Salt and water were always accessible. The foods consumed, gains made, and cost per pound of gain in the last experiment are shown in the following table:

SUMMARY OF RESULTS OF CALF FEEDING.

	Nutritive ratio of ration.	Total gain.	Average daily gain per head	Dry matter eaten per lb. of gain.	Cost of feed per lb. of gain
		lbs.	lbs.	lbs.	cts.
Lot 1. Skim milk, hay, with linseed meal....	1:3	483	1.63	4.13	2.5
Lot 2. Skim milk, hay, with oatmeal.....	1:4.1	498	1.68	4.31	2.2
Lot 3. Skim milk, hay, with flaxseed and corn meal.....	1:4.8	489	1 65	4.32	2.3
Lot 4. Skim milk, hay, corn meal.....	1:4 9	509	1.72	4.16	2.0

"From these figures it appears that the best and most economical gains were made on corn meal and skim milk. Comparing the results of all the tests made, it is found that 'in each of the three experiments conducted by this station, linseed meal has given lower and more expensive gains and has been in every way less satisfactory than either oat meal or corn meal and flaxseed.

* * * The results indicate that pure corn meal is superior to pure linseed meal for feeding calves in combination with skim milk.'

"While the results of these experiments are contrary to prevailing opinion concerning the relative value of these feeds, it is not unnatural or in any way unreasonable that the carbonaceous grains should be more suitable for feeding with skim milk than a highly nitrogenous product like linseed meal.

"The conclusion seems warranted that a nitrogenous feed, such as oil meal, is neither necessary nor most profitable to supplement a separator milk ration for young calves. All of these rations, even when corn and flaxseed were used, were narrower than whole milk, and it is evident that the element lacking in separator milk is not albuminoids, but fat or its equivalent—carbohydrates—in some form palatable and digestible to calves.

"In recent experiments made in Holland the effect of increasing the fat in skim milk for calves or of adding starch was tested. Sufficient whole milk was added to skim milk to make the desired amount of fat.

"When starch was fed it was cooked to a paste in the skim milk. About 94 per cent of the starch was digested, the co-efficient of digestibility being as high as in the case of the adult animal. The addition of starch to the ration diminished the digestibility of protein somewhat. It was, however, on the whole satisfactory, although the author believes that fat is preferable.

"A prominent French investigator has recently published the results of a number of years' experience in feeding starch and skim milk to calves, and regards this combination of foods as very satisfactory. He states that a calf weighing on an average of 70 lbs. at birth, should gain about 2 lbs. in weight a day, about 6 quarts of milk being required for this by a calf of the above weight. When the calf is eight days old, starch in the proportion of 1.7 ounces to a quart of milk may be substituted for whole milk. No bad results follow the change in feed and the gains made are satisfactory. The starch should be cooked to a smooth paste with half the milk used, then mixed with the remainder and fed warm. The value of this method of feeding from an economical standpoint is discussed at considerable length.

"These experiments all indicate that what might be expected on theoretical grounds is found to be the case in practice. It is known that the body requires protein for its growth and maintenance, and in addition fat and carbohydrates for supplying the necessary energy. Whole milk is the normal food of the calf; it contains a sufficient amount of protein. If the fat is removed, the skim milk supplies the same amount of protein as before, but something must be added as a source of energy. It is known that within limits fat and carbohydrates are interchangeable for this purpose. In the experiments cited above carbohydrates (either in form of starch or cereal grains) were successfully combined with skim milk, and in this way the animal was supplied with an abundance of protein and energy and made satisfactory gains. When it is possible to supply protein in a by-product, such as skim milk, and the supplementary material in an inexpensive form, the profitable feeding of calves is assured."

Our Special Elgin Letter.

Although the Call Board was quiet, butter men took quite an interest in discussing crop conditions favoring the dairymen. Not a few tillers of the soil were in attendance.

The Quotation Committee decided on 20 cents steady as the market price of butter. Last week the market was 20 cents steady, with an output for the district of 834,000 pounds; output this week 832,900 pounds.

There were no sales or offerings.

Former markets:

	Tubs sold.	Price.

BALTIMORE MARKET.

BALTIMORE, Md., July 9—Butter—There is little change to note in the condition of the market since our last issue. The receipts were unusually heavy on Monday: this is attributable to Saturday being a closed holiday. and stock that should have been delivered that day was not delivered until Monday. Buyers seem to have regained more confidence in the past two or three days, and several long lines of creamery have changed hands. In addition to the speculative trade, the local consumptive demand continues quite good. There has also been a fairly good demand from the out-of-town trade: consequently there has been no accumulation of desirable stock. Imitations are in ample supply; only choice and fancy makes will bring full prices. Ladles—All fresh and sweet stock meets quick sale, while defective stock is slighted. Packing stock continues in liberal supply; all fresh, sweet invoices are promptly sold on arrival, while off stock hangs fire. Blocks and prints are in ample supply for the requirements. The market generally closes quiet, with receivers quite firm in their views on all attractive stock.
Creamery Separator. extras, 21½c; firsts, 20@21c;seconds, 18½@19¼c. Iowa & N. W. Ladle, extras. 17¾c; firsts, 17c; seconds. 15@16c. Ohio & Indiana Ladle, extras, 17c; firsts, 16@16½c; seconds, 15c. West Va. Store packed, extras, —c; firsts, 13¼c; seconds, 12½@13c. Creamery blocks (2-lb.) extras, 22c: firsts, 21c; seconds, 19@20c; Creamery prints (⅛ lb) extras, 23c, firsts, 21@22c; seconds, 19@20c. Md. Va., & Penna. Prints. extras, 21c; firsts, 20c; seconds, 18@19c.
Eggs—While the receipts are only moderate, they are about equal to the requirements. The quality in many instances is running very unsatisfactory: hence. the loss-off is quite heavy. You cannot be too particular in grading and candling your eggs at the starting point, and be sure to pack in cases. The market closes quiet, but there seems to be a firmer feeling on choice stock. The market closed at 15¼ cents.
Cheese—The receipts are ample; demand sluggish; market weak and unsettled. Note.—Our quotations on Swiss cheese are for old stock; new will not command within 3 or 4 cents as much as old.
N. Y. State—Cheddars, fine, 10½@10¾c; choice, 10@10¼c; fair, 8¾@9¼c, Flats, fine, 10½@10¾c; choice, 10@10¼c; fair, 9@9½c; Small, fine, 10¾@11c; choice, 10@10½c: fair, 9¼@9¾c; Ohio Flats, fine, 9@9½c; choice, 8@8½c; fair, 7@7½c; O. Picnic, fine, 9@9½c; choice, 8½@9¼c; fair, 7½@8c; Swiss Cheese, (domestic) fine, 15@16c; choice, 13@14c; fair, 10@12c.
301 Exchange Place. G. M. LAMB & BRO

NEW YORK MARKET.

NEW YORK, July 11.—Butter— Receipts for the week, 70,680 packages. Exports for the week, none.
Trade has been good for long lines of fancy creamery butter to go in freezers, and speculators have been obliged to pay a slight premium when quality and quantity suited. Under grades of creamery make were inquired for and sold readily at 19 to 20c, and our market closes with firm prices for all table qualities of butter. Several lots of New York state dairy butter were sold at 17c, while selections of fancy tubs sold at 19 to 20c. Ladle and low grades Western butter are in liberal supply and prices only steady. The intense heat of the week has staggered local consumption and only the cold storage demand has saved prices from going lower. We quote:
Creamery, extra, 20½c: medium, 19@20c; poor, 15@17c; Dairy, extra, 19@20c; medium, 16@18c; poor, 14@15c.

Cheese—Receipts for the week, 36,184 boxes. Exports, 6,851 boxes
The market has been active all the week, and although prices were marked down at the close, there is no stock left over unsold, and receivers would insist on a premium before selling any of their best go ds. Exporters and home trade were liberal buyers and took both full creams and skimmed cheese. We quote:
Full cream, extra, 10c; medium, 9@9¼c; poor, 8@8½c.
Eggs—Receipts for the week, 60,892 cases. Strictly fresh laid stock was in very light supply and sold quick on arrival at 19@20c. All other grades were plentiful and freely offered at 13 to 17c. We quote:
New York & Penn, strictly fresh laid, per dozen, 19@20c; Northern & West-rn, strictly fresh laid, 18@18½c: all Sections, poor to good, 12@17c.
177 Chambers St, DAVID W. LEWIS & CO.

Angelus Herd Guernseys—For Sale—Bull Calf, superior breeding; price $50.00. Address MARCH, 39th & Western, Los Angeles, Cal. 23-tf

Wanted—I wish to purchase a retail milk business. Address with particulars. J. W. WILDER, Quincy, Ill.

For Sale—Dairy Farm, 576 acres, about 75 head well bred Jersey cows and heifers, herd in good condition, 1 mile from growing town of five thousand, dairy well established and paying handsomely Chronic illness requires sale, though sacrificed. Great bargain. Write for particulars. MRS. M. R. CARTER, Gainesville, Florida. 23-4.

Farm For Sale or Rent—A desirable stock and dairy farm in Winona Co., Minn., 13 mi'es below Winona, 2 miles from R. R. depot, 1,400 acres good land all fenced, well watered. There is on the farm a good 8-room dwelling house, two large barns, dairy building with churn, vats and implements for making butter, steam engine and 10 h. p. boiler, 75 cows, 450 high grade Shropshire ewes, 100 Angora gorts. young cattle and hogs. Running water in all the buildings. Will rent farm on shares with stock, or sell farm with or without stock. LLOYD BARBER, Winona, Minn. 23-3

Wanted—A good single man to take charge of dairy. Hollander preferred. C. M. BOTTEMA, Stockyards, Indianapolis, Ind. 23-2

For Sale—A 125 gal. milk route with 2 horses and 2 wagons and 40 cans. all in first-class condition. Ill health only reason for selling. For particulars address J. E. MARTINDALE, Benton Harbor, Mich.

For Sale—Seven miles east of Green Bay Wis., one well equipped cheese factory and small grocery store. 6,500 pounds milk daily. Fine location for a wide-awake man. For full particulars write to W. P. KRATZ, R. 3, Green Bay, Wis. 23-4

Herdsman Wanted—One familiar with care and feeding of Holstein-Friesians. Good references and experience required. Address F. W. ALLIS, Monona Farm, Madison, Wis. 23-4

For Sale—Cheap for cash, largest retail milk route in Sycamore, Ill. Rent 50 acre farm (good crops) buy milk, up-to-date machinery, four loads daily. Apply at once. GOVE & INGERSOLL, Sycamore, Ill

Experienced butter maker wanted at once. K. K. POWELL, Stevens Point, Wis.

For Sale—Or will trade for good farm. A first-class grocery with established cash trade in best residence district in Chicago. Only best land will be considered. Will pay cash difference. EDWARD G. WIDMANN, 8 and 10 East 47th St., Chicago. 22-2

Macon County, Missouri. Farm For Sale.—80 acres good land, well fenced, plenty small fruits; two-story 8-room frame residence, front and rear stairs, large halls. cellar 16x32; barn 42x60 with 12x60 leanto. All in meadow and pasture. Residence within 100 yards of depot just outside corporate limits town of 600, 4 miles of coal mines two thousand miners. Place to start a creamery. Six are shipping cream 75 miles away. Price $75.00 per acre, one-third down balance 5%. Write for particulars. CHAS. H. MARMADUKE, Callao, Mo. 22-4

Wanted—To buy a second-hand separator. Must be in good order. Prefer a Tubular. H. M. GRUBB, 1519 8th Ave., Beaver Falls, Pa. 22-tf

Fine Dairy Farm for Sale—Near St. Paul, Minn. 210 acres good land with ample buildings of all kinds. Page fence cedar posts. Pure bred Holstein cattle and Yorkshire swine sell readily at good prices. Good markets for all dairy products. Will sell with or without stock and other personal property. Easy terms. Enforced removal to California only reason for selling. T. S. TOMPKINS, Pasadena, Cal. 15-tf

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

Wanted—Single man on large dairy. Only good milkers need apply. F. W. ADAMSON, Lake Bluff, Ill. 4-tf.

Buff Jersey's latest book on Farm Stock and Dairy Work is full of practical things for practical people. The Silo, how to build and fill; ensilage, its value; soil, crops, variety and how to grow. Swine, poultry and many other subjects ably treated. Send 25c for copy. Monmouth, Ill. 47-tf

A FEW FACTS

Of Interest to Creamerymen in Farm Separator Territories

From the Report of the Creamery Station Operators' Meeting in the "Nebraska Dairyman" for June.

"Mr. Shopbell was of the opinion that the sale of Hand separators had just begun. He said they sold easier,—that suspicion had been allayed among patrons and they now realized the Hand separator was one of the most necessary pieces of machinery on the farm. He compared the cream separator with a self-binder. The self-binder cost a great deal more money than a separator. The farmer could not buy a self-binder on the terms given on a separator. The self-binder the farmer uses a week or ten days during the season—if he raises a crop—otherwise it is standing idle, rusting with age and non-use, bringing no returns and in no way assisting in the way of helping to meet the expenses of the farm or providing the family necessities. On the other hand, the cream separator is in use every day, the farmer needs it 365 days in the year, and with proper care one will outlast a self-binder five times. He said it was an easy matter in his territory to sell separators now. Farmers were sending for him to come and sell them one. It no longer required coaxing because dairying was accepted to be the most profitable part of the farm and farmers now realized a cream separator was indispensible—even more so than a sewing machine. He said that every woman on a farm could better afford to do her sewing with a needle and buy a cream separator instead of a sewing machine."

It is hardly necessary to add that Mr. Shopbell is selling DE LAVAL Separators and has been doing so for several years with great success.

A De Laval Catalogue or any other separator information desired may be had for the asking.

Mr. Wheaton's Canadian Dairy Notes

Dairy Legislation in Canada—Process Butter Refused Admittance—Creamery and Dairy Butter—Licensing Cheese and Butter Makers—Summer Milk—American Association of Institute Workers.

ED. HOARD'S DAIRYMAN:—After a pretty long period of freedom from the touch of the law giver, the dairy industry is shortly to feel the effects of some new legislation. The Hon. Mr. Fisher, Minister of Agriculture, has introduced a bill at Ottawa to still further protect the industry against the manufacture of spurious or adulterated dairy products.

This bill prohibits the manufacture or sale of renovated, adulterated or process butter, or of oleomargarine, butterine or other substitute for butter, manufactured wholly or in part from any fat other than that of milk or cream. The proper marking of butter is also dealt with and provision made for the examination of stock or packages.

The penalties under the act for manufacturing or dealing in oleomargarine, process butter, etc., are heavy, ranging from $200 to $400 for each offense. Fines ranging from $10 to $50 each, will apply to minor infractions of the law.

The need for further regulation of the trade in butter has come at the request of Montreal exporters, who with Mr. Fisher are desirous of maintaining the high standard of Canadian dairy products abroad. Since the introduction of more stringent regulations at Washington in regard to process butter, attempts have been made to introduce the manufacture of this article, which many consider to be only another name for adulterated butter, into Canada. To prevent any further attempts of this kind and to still further emphasize the position that Canada has always taken in regard to adulterated food products of any kind, this legislation is being introduced.

The bill as first introduced defined creamery butter as butter made in a creamery receiving milk from a stipulated number of patrons. This feature brought forth a lot of opposition from owners of private dairies, who, manufacturing after the creamery method, have sold their butter as creamery. Consequently it has been thought wise not to interfere with this class of butter makers in so far as the local trade is concerned.

With regard to the export trade the situation is different. For sometime past the practice has prevailed of sending to the British market, butter represented as creamery butter, but which was only butter made in small dairies, repacked for export and sent forward as creamery. Originally, this butter may have been good, but by reason of frequent handling and the unevenness of the quality in any large quantities of it, it has tended to discredit Canadian butter in the English market. As our export butter trade should be protected and only the very best quality sent forward, the original provisions of the act relating to the marketing of butter as creamery will be retained. This will of course, shut out the smaller concerns from the export trade, but will not deprive them of the privilege of selling their butter at home as creamery.

For some time, the creamery men of this province have objected very strongly to private dairies encroaching upon their preserves, by selling their product as creamery even on the local market. The enforcement of this act will, therefore, not help them any in the local market, as was first expected, and the grievance will still exist. But a half a loaf is better than none, and if they are given the exclusive right to the export trade, there should be little room for complaint from the creamery butter manufacturer.

But what about the fellow, who buys dairy butter in the corner grocery, thinking he is getting "creamery?" Is he not entitled to some protection? He has not raised any objection to changing the original bill as introduced, and consequently his interests will not be considered. It seems reasonable, however, to suppose that the consumer at home should receive as much consideration as the consumer abroad.

But so far, in nearly all our legislation in regard to food products, it is the fellow across the sea who receives first consideration. The cheese manufacturer sends his best stuff abroad and makes the local market the dumping ground for any "culls" he may have lying around. The local consumer gets even by eating less cheese and buying some other food to take its place. The same thing holds good with other lines, in which the best quality is selected for export. While such a policy undoubtedly strengthens the export trade, it tends to leave undeveloped a very profitable home market.

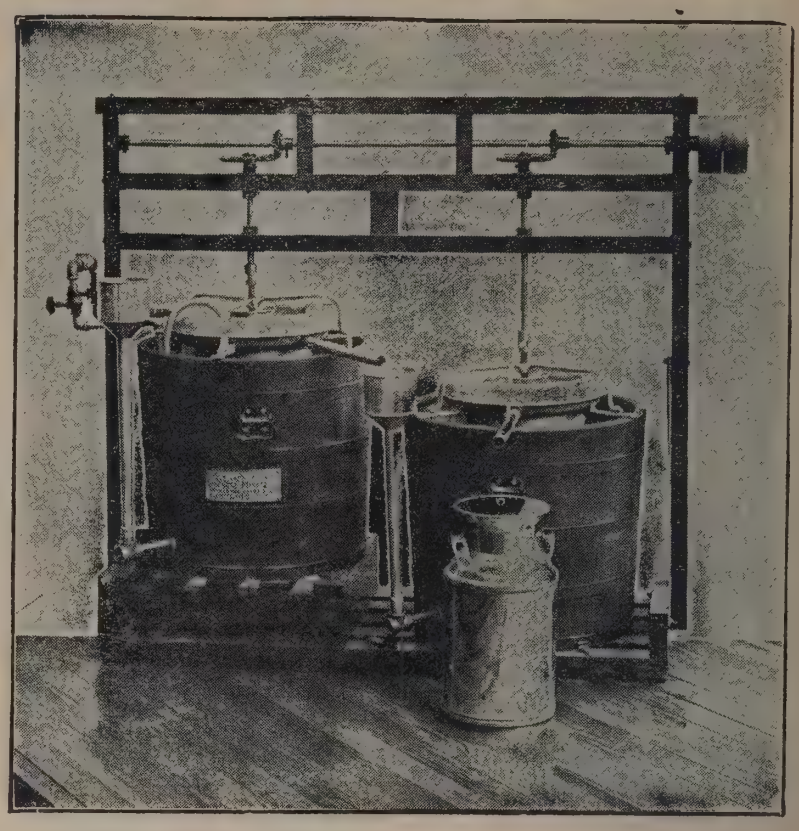
The Montreal Produce Merchants' Association have taken a very decided stand in reference to the licensing of cheese and buttermakers in the Province of Quebec. They have asked the Quebec Government to appoint a commission to examine butter and cheese makers and issue licenses to competent men, these licenses to be granted to such persons as upon careful examination are found qualified to manufacture cheese or butter of first-class quality, to judge correctly of the quality and condition of milk offered by different patrons, and to carry on the business in such a way that the interests of all concerned will be protected.

The association further asks that the goverment forbid any person, who does not hold a license, to manufacture cheese or butter at any factory at which milk from various patrons is received and at which the proceeds from all sales of the products are distributed among the patrons in proportion to the quantity, or to the quantity and quality of the milk supplied by them severally.

So far there has been no report as to what action the Government will take in the matter. Quebec has of late years been the leader in legislation having for its object the better education of the maker and the production of a higher quality of product, and it would not be surprising if the request of the Montreal Association were complied with and a system of licensing makers introduced. There has been some agitation in Ontario for the licensing of factories. Why not license the makers who will have charge of these licensed factories?

July and August are the trying months of the year for the dairyman. If the milk is not properly looked after during this period, difficulty is sure to arise in the quality of the cheese and butter output. And yet how difficult it is to get the average farmer to look after the milk during this busy season. The milking and the milk are only of secondary consideration with a great many and receive only secondary care and treatment. But how foolish this is. The haying and the harvesting, no matter how important they may be, are not sufficiently so to pay for neglect of the cow and her milk, which should be attended to with as much regularity and care as during any other season, and more so, as the warm weather will play sad havoc with milk that is not properly looked after.

Cleanliness, aeration and cooling are the three essentials for the proper care of milk at this season. Most patrons know, or should know, the importance of applying these in connection with the milk product. A little attention to detail, a little previous preparation in the way of providing facilities, and the thing is done, the value of the product increased, and the maker made happy.



A gathering of sufficient international importance to merit a reference in HOARD'S DAIRYMAN took place in Toronto, last week. It was the Eighth Annual Meeting of the American Association of Institute workers. About sixty delegates were present from Uncle Sam's domains, from as far south as Florida, and as far west as Minnesota. Delegates were present from the Canadian Northwest Territories, and from New Brunswick and Quebec in the East, while Ontario had a very large contingent. The Secretary of the organization is Mr. G. C. Creelman, Supt. of Farmers' Institutes for Ontario, so the association is international in fact, as well as in name.

The addresses and discussions were altogether along the line of making institute work on this continent more effective in conveying practical information to farmers in the best methods of agriculture, and in lifting up to a higher plane the home and the social life of the people who live on farms. That a great deal was accomplished in this direction will be shown when the full report of the proceedings is published.

The delegates and their friends were entertained by the Provincial Department of Agriculture on June 25th to a visit to the Ontario Agricultural College, at Guelph, which our American friends enjoyed to the utmost. The next meeting will be held at St. Louis, in 1904, at a time to be fixed by the directorate.

Toronto, Can. J. W. WHEATON.

A GREAT SUCCESS.

Truth to Tell

There are no other milk cans made that can equal in wearing qualities the genuine

BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned, **Remember**, the Buhl is the only can in the world that is made with the **Buhl "Victor" Can Breast** and the **Buhl "Victor" Round Handle.** As there are many inferior imitations of this can, we stamp all ours with the **Milk Can Trade Mark.** Look for it. Sold by all live dealers. Ask about them, or write us direct.

BUHL STAMPING COMPANY,
212 W. Larned St., Detroit, Michigan.

The Daily Routine at the Buff Jersey Agricultural College.

ED. HOARD'S DAIRYMAN:—I must again call the attention of those who write me for information to the necessity of enclosing a stamp for reply if they expect one. If my ability to answer questions were guaged by the number of postal cards I receive daily I might feel flattered, but I long since passed that stage andonly feel the lack of the two-cent stamp to return an answer. I am more than willing to answer all questions asked me as fully as I am able,that is what I am on earth for, partly, so enclose that stamp next time.

Last spring Mr. Howie, of Elm Grove (which is just ferninst where I took my first lessons in the art of dairying) at the Dairymen's Convention held at Fond du-Lac, told us of the daily work at Sunny Peak Farm. He brought out the point that system was the feature of all the daily transactions. I am always interested in such statements and hope Mr. Howie's paper will be read and the lesson it teaches will result in much good. This matter is so important that I wish to emphasize it by giving the daily work that is accomplished at our own farm, and it is accomplished without any confusion or needless steps, all owing to perfect system. There are no hired men or girls to wait on, which relieves us of some work. This is a handicap to many, but system even in that case helps.One who has hired help, can have them systematize their evenings out and drawing their pay, so that he can accomplish a great amount of work afield while the hired help catches up with their sleep, and see that their horse and buggy is in order for the next trip.

The Faculty of our Agricultural College now numbers eleven and each one of them has his and her department to attend to. Each step in the day's work is done at fixed hours and all work for the best interests of the whole. In this way, work assumes the appearance of recreation, so rapidly is it turned off. Our day begins at 4:45 o'clock; the swine department foreman goes to the night pasture for the dairy herd; the Prof. of Dairy Husbandry goes to the barn that has the work horses and gives them their feed, he then goes to the cow barn and prepares it for the cows. The butter maker and her assistant (who is a "her" also) go to the creamery and arrange for separating and churning. The assistant poultry manager gets together the milk cans and pails while I am looking after fire under boiler etc; etc. means any number of things. It is now five o'clock, which is our milking hour night and morning every day in the year. The professors and their assistants all have their own individual cows and they milk them in same rotation and stalls every day. Each cow's milk is weighed and recorded on the milk sheets,the assistant poultry manager having to climb on the milk can shelf to reach it, but she gets there just the same. As soon as the milk is drawn it is taken to the creamery where it is passed through a No. 3 baby separator and the cream at once passed over a Champion aerator, then shipped or put in the cream vat while the separating is being done.

The cows are driven to the day pasture by the swineologist, the Dairy Professor gets teams ready for the fields. Our hog professor has by this time returned from pasture and fed the pigs and hogs and intermediate sizes, their skim milk, fresh, clean and warm skim milk that does not have to be pastuerized, sterilized or swill-barrelized, to make a fit drink for our aristocratic Berkshires.

The hour is now seven o'clock and the Domestic Science department claims our attention for thirty minutes, after which the Professors of dairy and pigs hasten to the corn fields,while the creamery managers hasten to the creamery to do the washing up of the milk pails and cans together with the churning of the cream and putting the butter in pound prints and these prints in 54 lb. boxes ready for shipping.

The old,reliable, family horse stands at the creamery door, hitched to a light but roomy wagon,to take cream and butter to the express office. This horse is just as safe for our Professor of pet stock to drive as one of her kittens would be. Now,as all of the morning's work is finished, I have three and one-half hours to devote to the corn field, which means three and one-half acres of corn cultivated, or as much as most farmers accomplish in a half a day, that begins at six o'clock and ends at twelve. Not because they are lazy, but because they work so hard they do not have time to learn better methods and get the best tools for their work.

With my light team walking along easily,and myself comfortably seated with an umbrella over me I am in a good position to use my thinker, but the thinks I think will never reach the fellows who don't enclose a stamp. But at eleven-thirty we leave the field and do not return before one-fifteen, and at four-forty-five p. m. our field work ends, with 25 and 30 acres of corn well worked.

Last week we cultivated 50 acres at the rate of one team for the whole field, in 44 hours. At four-thirty the "her" professors again begin to count in the work by getting up the cows, getting the creamery in order and other helps against the milking hour.

Five o'clock finds each member of the faculty giving practical demonstrations in the art of good milking and proving Buff Jersey's method to be a good one. The separating done and cream well iced, hogs fed, and horses turned in the cows' day pasture, while the cows occupy the pasture set aside for them at night, brings our day down to 6:30, which is the end of the work day. All of the day's work has been done well and every member of the faculty and family have gained some knowledge in the different occupations and experiments. The evening, while short, gives us time for reading the journal and bulletins and commenting on them. To illustrate how even the little folks get ideas, will give as an example of our youngest, who is in charge of the pet stock, which consists of cats, doves and chance crippled chicks, etc. There are some new kittens that are taking up her time just at this time and each milking hour she is at the barn with a dish and insists on getting milk from the same cow each time. She has heard us commenting on the problem of rearing babies on cows milk and the advisability of giving them the same cow's milk.

Weight

Salt that makes weight makes money for the butter maker. DIAMOND CRYSTAL SALT—*"the Salt that's ALL Salt,"* made weight for one creamery at the rate of $8,000 a year in additional profit. The secret is simply this: Whatever weight you add in DIAMOND CRYSTAL SALT, *you obtain in increased weight of butter.* Its pure, dry flakes dissolve completely and become a part of the butter, instead of being washed out, or adhering to the worker rolls, like common, gritty, flinty salt. Our illustrated booklet "Just Salt" is just the thing for dairymen. Free on request.

(Read before the Wisconsin Buttermakers' Convention, Waukesha, Wis., by M. H. GARDINER.)

MR. PRESIDENT, LADIES AND GENTLEMEN:—I do not know that the mere secretary of a creamery company has any real standing in a buttermakers' convention, so I will say at the start that I do not come here on the invitation of your able secretary to instruct, but have written this paper on some of the advantages and disadvantages of the whole milk creamery, merely to aid in getting the matter before the meeting for discussion. It is something which ought to have been written by an active buttermaker, for this convention is hardly the place to put forth any argument resting on theory, but I will say that my observations have been helped by the fact that I was an expert buttermaker in my younger days, and under the old dairy system, able to make butter selling for 32 cents per pound by the year, to city customers. For many years I have been secretary of the Darien Creamery, a medium sized, very successful creamery, with a $5,000 plant; so I have kept well in touch with butter and buttermaking.

It is generally admitted that the proof of the pudding is in the eating; so, likewise, a buttermaker's skill is measured by the quality of the goods he turns out. The average buttermaker usually stands between the devil and the deep sea, between the patrons who furnish the milk or cream, and his employer or employers, who are often these same patrons. He is expected to be a sort of necromancer, who, by touching any quality of milk or cream with the magic wand of his skill, can evolve from it the finest quality of butter, which shall grade and sell as "extras," and if for any reason he is unable to do this, he is declared a fraud and a failure. As I understand it, the object of the discussion today is to determine which of three methods of getting the butter fat of milk into the buttermaker's hands is economically best; for by that method, whichever it may be, the milk will bring the highest price to the producer. If, incidentally, this method could also be made best for the buttermaker, we should have the ideal system, and that is the system we are looking for. In my own opinion we are in a transition stage, and are going back eventually to the old cream gathering plan, with farm separator attachment; for I believe that this system will eventually prove most profitable to the producer, and whatever plan accomplishes that object wins. But I also think that there will be need of much teaching before the average creamery patron will be apt to follow this plan successfully.

The main advantage that I see in the whole milk creamery at the present time is, that the system, by placing the milk more directly under the control of the buttermaker, is conducive to the production of the best quality of butter. The producer is always more or less a judge of milk, and it is an easier matter for the buttermaker, by smell and taste, to point out its defects, and so educate the producer; and when such a man finds that his milk is sometimes rejected, or at least not satisfactory, and has the reason explained to him, he will, in most cases, try to do better. Thus, the whole milk creamery is a school, with the buttermaker as instructor, with whom the patron or his agent comes in daily contact, and the hint dropped here and there, or the wise word spoken in season, will slowly but surely affect the whole community. You all know that there are some men who have to be hit with a club before they can take a hint, and a buttermaker must use his discretion in such cases. I well remember the regeneration of one of my neighbors nearly 30 years ago, when the first cheese factory was started at Darien. The cheesemaker who was also proprietor, and had seen his month's make of cheese cut 2 cents per pound in price on account of their peculiar flavor, lost his usual suavity and told him with a good many blanks that unless he could bring milk to the factory that did not have to have the last quart or two in each can poured out on the other side of the wagon, he need not trouble himself to bring any more. The medicine was harsh but effective. I think that one of the main advantages of the whole milk creamery is in the bringing of patron and buttermaker into closer relations.

While it was not my intention, in jotting down these thoughts to be specific, but rather suggestive, leaving such matters for the discussion, allow me to turn aside for a moment to express my hearty commendation of Mr. Anderson's words last evening as to the necessity of the buttermaker being thoroughly fitted for his profession, I might almost say art. It used to be said that buttermakers, like poets, were born, not made; but that was when buttermaking was largely intuitive and there was little or no chance for getting instruction; but now all that is changed, and there is no excuse for a buttermaker to be incompetent. Your work is supplementary to that of the milk producer, and therefore you must not be ignorant of his work; for your calling forces you into the position of instructor, and the blind make poor leaders for the blind Most of you come from the farm, and have there learned something of the underlying principles of milk production, but you have only a smattering of such knowledge, and in order to visit your patrons in their homes, as you should, and to talk intelligently with them, you must thoroughly post yourself on feeds and feeding.

In your own particular line there is no excuse for ignorance; the state is doing much, and it will do more if you deserve it. Not only the state but the nation is proud of the corps of instructors, at Madison. They will gladly teach you what is known, and will find out, as far as they can, all that is knowable; for they are not only teachers, but are students themselves. With such advantages then as Wisconsin offers to her buttermakers, there can be no excuse for the close relations of buttermaker and patron not being highly beneficial to the latter.

When the milk has been delivered, and the patrons are awaiting each his turn for the skim milk, they are brought into close contact with one another; and in the discussions carried on, there is much to stimulate and encourage. Patron Smith is usually anxious to know how Jones, with just the same number of cows as he milks, can get a monthly check 25 per cent larger than his; while Brown is inquisitive to know if it is Tompkins' silage that enables him to bring six cans of milk now, when he used to bring but four. Thus, quantity and quality of milk, breeds and breeding of dairy cattle; feeds, feeding and general care,—all are discussed, and mixed with the usual neighborhood gossip, a miniature farmers' institute is in session every morning. This is all beneficial to patrons and to creamery. Another point is that the patron takes a greater interest in the success of

Is Your Milk Good?

Used Summary Methods

Milk of Doubtful Quality Which Came from Calhoun Dumped Into the Lake by Inspectors.

Sixteen gallons of bad milk were dumped into the lake this morning by Inspectors Cunningham and Kiel of the health department. The milk came from Calhoun. This is the health department's summary method of disposing of milk that does not come up to the standard set by the law and a half hundred families were saved the discomfort and danger of drinking poor milk.—*Wednesday, July 1, 1903, Evening Wisconsin.*

A BUTTER PROBLEM

THE AVERAGE COW.		A WINTERGREEN HILL COW.	
130 lbs. butter per annum at 18c	$23.40	739 9.10 lbs butter, per annum at 25c	$184 97
Skim-milk	11.74	Skim-milk	21 94
Total	$35.14	Total	$206 91
Deduct the usual allowance for keeping	35.00	Her keeping for the year cost	54.75
Profit	.14	Profit	$152.16

The above comparative statement shows what may be accomplished by a cow bred and trained for a special purpose. It is within the power of any farmer to increase his results at a very moderate outlay by introducing better blood into his herd through a well bred sire. A treatise has been prepared giving hints believed to be of value to any one wishing to investigate the subject. It will be sent, free, with bull sale list, to any one contemplating a purchase. The list includes bulls of all ages, of good breeding, and offered at reasonable prices Address

WINTERGREEN HILL FARM, Dept. A., Scottsville, N Y.

JERSEY BULL, one year old. Good individual of the best breeding. Also 7 months bull from tested dam. Herd headed by Fontaine's Owl, 60436. Prices on application. Address,
J. F. EGERTON, Footville, Rock Co. Wis.

JERSEY BARGAIN.
REGISTERED YEARLING BULL, sire a son of Brown Bessie, winner of 30 and 90 days butter tests, Chicago, 1893. Dam traces to Eurotas (778 lbs. 1 yr.). Mary Anne of St. Lambert (867 lbs. 1 yr.), also Brown Bessie; fat tests showed 364 lbs. 1st. season, within year, and 15 lbs. 1 oz. (258 lbs. milk) in 1 wk; died of milk fever this (3d) calf. Thrifty, solid color.
E. E. STEVENS, North Madison, Ohio.

the creamery the closer he is brought in contact with it; and that his daily visits to the creamery effect him in a vastly greater degree than would the daily visit of the cream wagon to his farm.

The influence of the whole-milk creamery on the matter of good roads can hardly be overestimated, and I know of nothing that will convert a narrow, close-fisted, unprogressive man to the good roads idea, any quicker than to have to draw his milk in all weather to the creamery, for 365 days in the year; especially if he breaks down now and then, and has a good sized repair bill to pay. The broadening of a man's ideas even on the matter of good roads, prepares him for further advances in the creamery business; it is a part of his education.

There are two great disadvantages in the whole-milk system to be mentioned, the carting of the skim milk both ways, and its quality. As to the latter, the main fault has been in the adding of water to make it hold out; and in the winter season, which is the only time of year when it can be used to advantage for calf feeding, there is the trouble of warming it. The Darien creamery is co-operative to the extent of making the butter for all patrons on the same basis; but it is, strictly speaking, a pure stock-company. At the start, the Board of Officers determined that there should be no water added to the skim milk; and we knew that the patrons would not divide it equitably among themselves. We did not wish to bother with milk-weighers, check-pumps and other like methods, on account of the time wasted, and so hired a man for $12.00 per month, to be on hand each morning for 3 hours to divide the milk. It is now the eighth year of this system, and our patrons will have no other; it saves their own clothes, and they can send wives or children with the milk if they desire, while the man becomes expert in the filling of cans, saving time, and not slopping everything up. The skim milk vat is like the receiving vat, only much smaller, and is kept just as clean; and all buttermilk, as well as any skim milk left on hand, goes into the buttermilk tank. So, during the winter or cool season at least, our plan furnishes the skim milk in fairly good condition; though there is the trouble and expense of warming it. I am a breeder of Holstein-Friesian cattle, and am considered to have one of the best herds in the state; but my calves are raised on this skim milk, and I have not sold one in two years for less than $100.00. Of course I would prefer the warm skim milk from the farm separator, and only mention the matter to show that creamery skim milk need not be necessarily altogether bad.

But the carriage of the skim milk both ways! There is where the rub comes in the present system. I have made a careful computation of the average cost of this cartage at our creamery, and am firmly convinced that 2 cents per pound butter fat is rather below than above actual cost to our patrons; which would be about 2½ cents per pound of butter made. In addition to this I found that if the cream could be delivered into our cream vats in as good condition as we now get it there, there would be an average saving of a trifle over two-thirds of one cent per pound butter made, in our expense bills; so that with us the whole milk system costs for the delivery of the whole milk fully 3 cents per pound for every pound of butter made, and in addition the fuel used and trouble in warming the skim milk for calves in winter. I raise calves in the cool season, and in summer feed the milk to Poland China pigs; for in warm weather it can only be kept sweet a few hours after getting it home. The question then is as to whether it would be better for our patrons to change this system. There would be a saving per average cow of fully $5 on milk delivery, and I am sure that the increased value of the skim milk could not be less than 5 cents per 100 pounds, or $2 per average cow more; or taking both savings together, $7.00 per average cow. Out of this would have to come the cost of cream delivery, the loss of the butter milk, unless some plan of utilizing it for pig feeding near the creamery could be put in practical operation, and any loss that might ensue through the making of a lower grade of butter.

It is this last clause that troubles me. A butter maker has it hard enough at the best; and when I think of his being required daily to turn out a uniform product of butter of the highest grade from a mixture of 100 different lots of cream, in 100 different stages of ripeness, to say nothing of the possibility of 100 varieties of flavor and degrees of cleanliness, I am at a loss. The only hope of uniformity in such cream production that I can see, will come from education and training; for, as I mentioned before, that plan of getting the butter fat into the butter-maker's hands which pays best to the milk producer is the most desirable, and must win in the end, even though the butter turned out under it be not of the highest quality; and the butter maker should make it his main object to so educate his patrons in the production of butter fat, that the plan which is most economically productive for them shall also be conducive to his turning out the very highest quality of butter.

HOLSTEIN-FRIESIAN ASSOCIATION OF AMERICA.

President, HENRY STEVENS; Secretary, F. L. HOUGHTON, Putney, Vt.; Superintendent of Advanced Registry, S. HOXIE, Yorkville, N. Y.

FEES FOR REGISTRY.

Wm. O. Jackson & Sons, South Bend, Ind.

LOOK HERE.
34 cows and heifers in the McGEOCH HERD have been officially tested with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by Gem Pietertje Hengerveld Paul DeKol, or Sir Ormsby DeKol for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days, average per cent of fat 4.47. Are these the kind of Holstein-Friesians you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd? McGEOCH HERD is located at Lake Mills, Wis., 56 miles west of Milwaukee. For particulars address H. B. Daggett, Mgr., Station A, Milwaukee, Wis. Residence: National Ave. near 40th. Phone, South 1601

Pennsylvania Pickings.

ED. HOARD'S DAIRYMAN:—We eastern farmers are up to our elbows in harvest. We have had the usual trouble of getting laborers, and the question that oftenest comes up when two or three of us are gathered together is: "What are we going to do for help?" And still the question goes unanswered. With all our trouble in harvesting them, our crops are fairly good. The late cold in the spring injured the rapidly growing wheat somewhat, while the cold and the subsequent dry weather made our hay fields objects for us to become self-commiserative over, but the rains that poured down upon us almost without ceasing during June, rejuvenated the grass fields marvelously and redeemed in part our harvest of hay.

There has been but little clover cut this year. The new seeding was almost universally a failure and as our clover usually lasts but one year, there was very little to cut with the timothy on the older sods. We have the unusual market condition of hay selling for more than the price of wheat bran. Not that bran is not entirely too high for profitable feeding, but that hay is at an altitude where it is immensely more profitably sold than fed. In fact, he is an improvident dairyman who feeds any timothy hay when its market price is any where near as high as it is now. With the many substitutes that can be grown as regular crops, and often as catch crops, any of them equal in feeding value to timothy, and many of them much superior, the necessity for feeding the more expensive, salable forage is removed. It is a fact too, that should be known by all farmers that timothy hay, as usually made, has been allowed to reach the stage where it carries a very low feeding value, as compared with its feed content if made into hay earlier in its growth.

As a substitute for timothy hay that I desired to sell, I have found it perfectly feasible to cut the timothy about July the first, and as soon thereafter as possible start the plow and as fast as the ground could be plowed and prepared, plant to fodder or hay corn, at the rate of about one bushel of seed per acre, in rows three feet apart, and keep well cultivated.

This corn will of course make no ears, retaining all its nutriment in its body, and makes a heavy yield of palatable and very nutritious hay.

When the growing season is long I often am able to cut this corn before frost, but when an unexpected frost anticipates me, I cut it at once. It is shocked after cutting, in shocks of large size, the corn being well set up and the shock securely bound. In such a shock the fodder cures a beautiful green and with a retention of aroma very grateful to the fastidious sensibilities of a well bred cow.

For feeding horses, I prefer this hay to timothy, but the primary object in producing it, aside from its intrinsic excellence, is in the fact that I am thus able to more than double my hay crop, making it possible to sell that which is salable and less valuable to feed, without in any measure depriving my stock of its free-born right to be well fed—the reverse of which is too often true for profitable dairying, when hay and grain bring good prices at market.

CRIMSON CLOVER IN IT.

Now, as a supplement to the above plan of making hay, if the season is favorable for its growing, I sow crimson clover in the hay corn at its last cultivation. This favorableness for the crimson clover is estimated from the amount of rain fall concurrent with the growth of the corn. As the cultivation of the corn is thorough and frequent, the seed bed is ideal for the clover. The ground is good, having sometime each year a coat of good manure and an application of a chemical fertilizer with each crop it produces. The clover is sown a peck per acre and harrowed in two inches deep. If an unlucky corn root gets broken it can go mend itself, as its owner does when he gets "broke."

The clover under these conditions rarely fails to grow and flourish, but if after the harvest of the corn I find it has failed, I harrow the ground once without disturbing the corn stubble, and sow two bushels of rye. Timothy rarely makes an aftergrowth worth anything as a hay crop, and by this plan I not only get my extra corn hay, but either in the clover or rye occupying the land through the fall and winter, I have an occupant much more highly valued than a timothy stubble. If the intention is to use the field thus managed for cured corn and stover the next year, the clover or rye is plowed down. If for ensilage corn, the clover or rye is cut for soiling as long as possible, when what is left is cut for hay and the plow started for corn.

I am making the experiment this season of sowing orchard grass with my crimson clover, and expect thereby to increase the yield of hay and improve its curing qualities somewhat.

ALFALFA.

My last experiment with this crop was a sowing I made Aug. 1st, last year, plowing the land after wheat. Some volunteer wheat came along with the first growth of alfalfa this spring and was cut with the alfalfa. The second cutting has been made this summer, and I expect to have one and perhaps two more. When I have sown alfalfa in the spring, I have been defeated by the growth of weeds crowding out the alfalfa. By sowing late I can encourage the sprouting of the weed seeds and destroy them by cultivating before sowing.

Mr. T. C. McIlvain, of this state, who sowed alfalfa about the same time I sowed mine last summer, is fully satisfied with the plan and recently showed me some sample plants that had grown 3½ feet tall.

There is no doubt that we can successfully grow alfalfa in Pennsylvania, but whether it shall be for us the harbinger of all that is good in farming and stock husbandry, that some claim it has been for them, remains for later demonstration.

DAIRY AND FOOD COMMISSIONERS.

This official, in Pennsylvania, is appointed by the governor, and as our present governor represents a pretty thorough change of administration, within party lines, everything of any consequence politically was cleared out. Pearson, as veterinarian, and Rothrock, as forester, were happily not removed, as their offices, under their superb administration of them, have not degenerated into politics. The director of farmers' institutes was ambitious to graduate into Secretary of Agriculture by the cocoon process, but had to be satisfied with remaining in the infant class. They tell us that a great educational work is possible by means of farmers' institutes. If this is true, and I am not questioning it, Pennsylvania farmers need all the good of it, and not seeing the good, they are right to complain, and should demand that the atrophied head of the work in this state be cut off.

The Dairy and Food Commissioner is supposed to hold his office by political tenure. Why this is so, we purveyors of food cannot understand; but a man may be a politician, or represent a political idea, and have an honest conception of the duties and obligations of his office. Thus our new Commissioner seems to be getting after dealers in oleo, and other things unfit for human eating, and making the way hard for the transgressor. There are those who say that the act creating this office provides that the one filling it shall be a man identified with dairying, or having a knowledge of the production of dairy foods, but these people belong to that disgruntled class that does not understand why these really important offices should have become political jobs, W. F. MCSPARRAN.

Prince Edward Island Dairying.

ED. HOARD'S DAIRYMAN:—All the cheese factories in the province, with three exceptions, are now under way for the season's work. Some of them began operations in early May, but the majority did not start this year until June 1st. The cold, backward spring is responsible for this, and, even as it is, when the present poor condition of the pasturage is noted,

The New 1903

REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

A. H. REID, 30th and Market Sts., Philadelphia, Pa.

WE TAKE THE RISK

of your being satisfied, and glad you bought the cream separator that makes money for you.

THE AMERICAN

Is Sold On Trial.

FARMER BRIGHTON, FAIRFIELD, IOWA.

the opening on June 1st is by no means late for not a few of them.

The season keeps very backward, and pasturage has come on poorly. The hay crop bids fair to be a light one, though clover is bound to be a fine crop. The winter's snows fell early, and remained on the ground all winter and early spring, covering the ground as a blanket and in this way protected the clover roots. The prospect of a fine clover crop is indeed encouraging, though timothy and the pastures are poor and backward.

Some of the season's cheese has already been marketed at 11c. The first meeting of the Provincial Cheese Board will be held at Charlottetown this week. At this meeting an effort will be made to secure the services of Prof. Zufelt, who had charge of the dairy school here last winter, to assist Inspector Morrow in the work of inspection and instruction. This year it is expected that there will be more cheese and less butter manufactured than last year. Provincial cheese has a higher standing in the British markets than its butter, and the price of cheese is high. Only one new creamery has been opened in the province, that at Launching. The able and aggressive friend of the Prince Edward Island farmers, Rev. Father Burke, of Alberton, President of the Fruit Growers' Association, and first and foremost in all and everything for the benefit, progress and uplifting of the people, is out this week with a press bulletin, entitled "Improve Cheese and Butter". The bulletin is timely and to the point.

Father Burke concludes his timely bulletin by urging the buyers to help get at the root of the evil complained, and utters the truism, that it certainly pays no one to export bad cheese. He urges more and rigid inspection, and an extra man if possible. This the Dairy Associations are making an effort to do. He hopes to see the time very soon when not only Canada will be branded on the cheese, but also Prince Edward Island.

An important conference was held at Montreal lately between members of the Montreal Produce Merchants' Association and a number of cheese and butter buyers and makers of Ontario and Quebec. Prof. Ruddick, chief of the Dairy Division, had charge of the meeting. The purpose of the meeting was the necessity of a higher and more uniform standard in making and handling cheese and butter. There was practical unanimity among both buyers, makers and producers in accepting the following definition of terms, both in butter and cheese:

BUTTER.

Finest creamery butter shall be butter made in a creamery under the system known as the centrifugal or separator process.

Flavor—Sweet, clean and fresh.

Body—Good and uniform and not loose made or watery; must contain less than 16% moisture to conform to the law of England. With proper care none of our Canadian butter should contain more than 13% of moisture.

Color—Even and uniform; should be straw colored or pale, but not white or lardy.

Salt—Must not be over 3 per cent, unless especially arranged for.

Package—Boxes must be strong, well made of seasoned wood, properly parafined; of the uniform capacity of 56 lbs., clean and in good condition for shipping. When hooks are used, four hooks on each box. Tubs must be strong, neat and uniform in size. Pure vegetable parchment paper of not less than forty pounds to the ream must be used for lining all packages.

CHEESE.

Flavor—Clean and pure.

Body—Close, good and well cured.

Texture—Silky, solid and meaty.

Color—Good and uniform.

Finish—Of good shape, and fairly uniform in size, neat in finish, with good rinds and clean surfaces.

Boxes—Must be strong and close fitting.

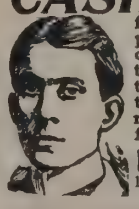
There seems to be a general move all round and a strong determination for a more uniform standard in manufacture, and more care in the packing and shipping of the goods to market—a determination that cannot fail of bringing forth good fruit. J. A. M.

UNDER the title of "Finding his Work," is the following note describing what the son of a wealthy American is doing. There are many "sons" who are studying "art" and practicing the various overloaded professions who would make good and successful farmers, but they are driven into a profession because they think that is the passport to success, whereas it is usually the direct path to genteel poverty.

The son of an immensely wealthy American, having graduated from college, went to Paris to study art. He worked hard in the Paris studios for three years. One day he made up his mind that he would never be a great artist, and that he would rather be a successful farmer than a fairly successful painter. Now—although still a young man—he has a model farm covering 10,000 acres in Illinois. He knows every foot of it, what it should produce, and sees that it produces everything it should. He has built a magnificient house, in which not an ornament jars the finest taste. He goes to Europe every winter and studies European methods of scientific farming and cattle raising. He is developing the land as his fathers did before him. He employs scores of men; he helps the smaller farmers about him; he is likely to be a great factor in the development of the state during the next few years. And this is the story of a young American who works for the love of it, and who is a great success because, anxious to do things, he knew when he had not "found his work." —*The World's Work.*

"I've Lost Ten Pounds"

A man says. "Look at this." And he over-laps his coat to show how loose it is. There are some people who can lose *fat* to advantage, but the loss of flesh is one of the accepted evidences of failing health. As flesh-making processes begin in the stomach, so naturally when there is loss of flesh we look first to the stomach for the cause. And the cause is generally found to be disease of the stomach and digestive and nutritive tracts, resulting in loss of nutrition and consequent physical weakness.



Doctor Pierce's Golden Medical Discovery restores the lost flesh by curing diseases of the stomach and other organs of digestion and nutrition and enabling the perfect digestion and assimilation of food from which flesh and strength are made.

"My wife was for five years troubled with indigestion of stomach and bowels, bloating and severe pain at times during the entire five years," writes Mr. J. Milton Unger, of McConnellsburg, Pa. "Her heart was affected, and she took a purgative every few days but only received temporary relief. She got very poor in flesh and I bought one bottle of Dr. Pierce's Golden Medical Discovery from our druggist and after taking it she said she felt like a new woman. Has no more trouble with stomach and bowels, and has no pain nor bloating. Has gained fifteen pounds in weight."

Dr. Pierce's Pleasant Pellets cure constipation and biliousness.

The Value of the Skim Milk.

The New York *Farmer* reasons as follows on the question of whether it is always the farmers interest to sell his milk direct to the condensing establishments or take it to a good creamery:

Co-operative buttermakers, who can secure enough winter milk to make butter, ought to be in a position to beat even the Borden prices for milk in November, December and January.

Co-operators should bear in mind that the Borden price, which is called "net to the farmers," is not really "net" when it is compared with co-operative creamery returns. Suppose the Borden November price is $1.55 in the 26-cent zone, and $1.60 in the 29-cent and 32-cent zone, and that the co-operative creamery butter return is exactly the same figure in those zones.

Which is preferable and more profitable to the farmer? The condensary has absorbed the butter fat and the skim milk and returned $1.60 per hundred weight to the farmer.

The creamery has absorbed the butter fat and returned for it $1.60 per hundred weight of milk, and in addition to that return it has given the farmer back the skim milk, valued at 15 to 25 cents per hundred weight, for feeding, swelling his returns to $1.75 or $1.85 per hundred weight of milk.

This computation has been too often overlooked by producers.

The Borden price is for milk that is fitted to produce a large percentage of fine butter, whose market value is greater, in some cases, than the Borden price for the entire milk. For this reason the milk that commands the Borden price will command more than the Borden price when made into butter by its producers, who will have the skim milk to feed or to convert into casein.

Co-operative buttermakers, who make high-grade butter, can beat even the current Borden schedule of prices.

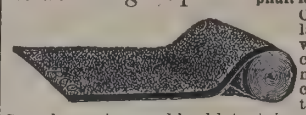
A California Feeding Query.

We have plenty of good alfalfa hay. Can get bran for $1.15 per 100 lbs.; cotton seed meal, at $2.25 per 100 lbs.; oil cake meal, at $2.15 per 100 lbs. If that will not make a ration, what would you advise getting, to get the best returns from the cows? And also will you please tell me if it is possible with the use of registered bulls to breed up common cows so that in time you can have a band of registered cows? If so, how long?
Chino, Cal. W. A. S.

Neither bran, cotton seed meal nor oil cake meal are especially called for in connection with good alfalfa hay. In California, we should be disposed to use either ground barley or oats, or a mixture of both, with possibly the addition of some bran, and should expect to feed, to cows fresh in milk, an average of about eight pounds per day, with all the the alfafla hay they would eat without waste.

It is not possible to develop stock eligible to registry in the manner suggested.

CONCERNING OUR ADVERTISERS.



If you are interested in a post that can neither rot or burn up, write to the Janesville Cement Post Co., Janesville, Wis., for their circulars. They have a small ad in this issue. Write for the circulars,

Safety Appliances on Ensilage and Feed Cutters.

So many accidents have been reported in connection with the operation of ensilage blowers that too much care cannot be taken to see that every precaution has been observed by the manufacturers of these machines to ensure their safe operation. The Smalley Blowers, made by the Smalley Manufacturing Company, Manitowoc, Wis., are built with safety fly-wheel and pulley just the same as when carriers were used. The driving device is new. There is no wasted power and belt will not slip. All parts are made of best materials, frame is strong and the strain is no greater with blower attachment than when the ordinary carrier is used. The largest size machines will easily handle ten tons of ensilage in an hour, cut one-half inch, and elevate into any silo. Self-feed machines are made in six sizes and hand-feed in twelve sizes. An interesting catalogue telling all about these machines and full line of drag and circle saws, sweep tread powers, etc., will be sent free on request to the manufacturers.

The "Sweepstakes" Babcock Tester sent on approval, if satisfactory remit the price, $5 00, if not return by express at manufacturer's expense. This is the proposition made by M. A. Luther Bros. Co., Milwaukee, Wis., in their advertisement, this issue. A more liberal or fair proposition could not be submitted and it is pretty good evidence this firm is making a tester that is satisfactory in every way. There are hundreds of the readers of Hoard's Dairyman that should take advantage of this offer. No money advanced. The Tester sent you on 10 days trial to be remitted for if you want it. Don't let this opportunity go by; look up the ad. Let them know that you appreciate a liberal proposition like this from a reliable firm. Any reader of Hoard's Dairyman who has any reason to think he would like a Babcock Tester should accept this proposition.

CHAS. H. CHILDS & CO., Sole Manufacturers, 15 LaFayette Street, Utica, N. Y.

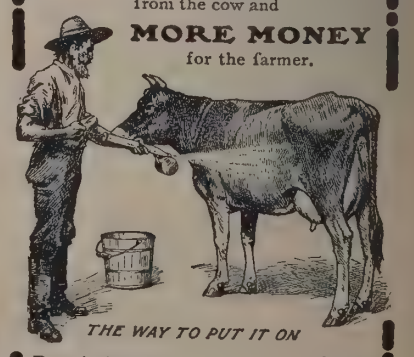
D. M. Osborne & Co., St. Louis, Mo. Caledonia, Mo, June 1, 1903.
My Dear Sirs—I feel I honor my own judgment, and reflect only that which is justly due your corn harvester, when I say it is without doubt the best corn harvester on the market to-day. Last season I cut, on my own farm, 115 acres of corn, and a negro boy 16 years old managed the machine, drove the horses and did all the cutting, without one cent expense for repairs or breakage. The work could not be excelled. The corn was heavy and much of it down, and some full of weeds, but it made no difference to the machine. All corn looks alike to an Osborne Corn Harvester, and to Missourians your machine is peculiarly adapted, for it can most certainly "show them." I am, Yours very truly,
W. R. GOODYKAUNTZ,
Ex-Senator of Missouri.

OSBORNE

This Corn Book tells about Silos and Fodder. Book Free for the asking.

Scotia, N. Y., April 15, 1903.
D. M. Osborne & Co., Auburn, N. Y.
Dear Sirs—I am well pleased with the Osborne Corn Harvester I purchased of your agent, C. H. Bevis, last fall. It proved to be all it was commended. On account of the season, several places in our corn fields were deep mud, but where we cut there the machine worked just as good. The broad-faced steel drive-wheel is a great advantage on ground where it is soft. We used only two horses, and did the work easier than some of our neighbors did with three horses on another make of machine. It is certainly a very light runner. It is also a fine binder, never once having broken the twine, or missing to tie, thus using less twine than others, besides delay and trouble. I would say, in a word, that the machine is practically perfect. Very truly yours, CHARLES P. SANDERS.

KILLED BY THE FUMES.
You must kill the lice on the fowls some way. If you don't care to handle them singly, use our liquid
PRUSSIAN LICE KILLER.
Simply paint the roosts and drop boards with it. The fumes arise and kill the lice on fowl and pen. It catches them all to the last mite, and it takes the nit as soon as it comes to life. The fumes do the work. It is the perfect, easy method of protection and cure. But if you like the powder treatment better, don't forget the old reliable Prussian Lice Powder.
Enclosed please find 40 cents for another can of lice powder. We were well pleased with the first can, but we need and must have more.—H. F. Lake, Yankton, S. D.
Prices: Lice Killer, 50c and $1.00; 5 gallon can, $4.00. Lice Powder, 25c; by mail 40c. Remember also our famous Prussian Poultry Food. Get either of these from your dealer. If you don't find them write us at once. We will supply you and send you also our 68-page book.
PRUSSIAN STOCK FOOD & REMEDY CO., ST. PAUL, MINN.
Special Agents: Portland Seed Co., Portland, Oregon. H. W. Williams & Co., Ft. Worth, Texas.



Goodwin's

T. D. Goodwin & Co.,
USE GOODWIN'S FLY KILLER this season and make your stock comfortable. Your cows will give 25 per cent more milk; your beef cattle will fatten with one-half the feed and your horses will do their work with ease. Goodwin's Fly Killer will protect stock from flies when in pasture as well as in stable. It's convenient, cheap, practical. It's a sure lice killer and will keep stables and hog pens in a sanitary condition. Prices: Gallon 75c; 5 gallons $3.00; 10 gallons $5.50. Good sprayer for applying same 50c, or send $1.00 for Sprayer and enough Fly Killer to protect 150 cows. Agents wanted. T. D. GOODWIN & CO., Columbia Station, Ohio.

Shoo-Fly THE ANIMALS' FRIEND

Kills every fly it strikes; keeps off the rest. Harmless to man or beast.
This cow was a terror to milk prior to using ½ cents worth of Shoo-Fly. Had it been used earlier, she would not have lost milk and flesh to the amount of $14.00. The other cow was protected early and continued to give 18 qts. of milk daily through fly-time
Shoo-Fly is the original stock protector used by the same dairy-men since 1885, after testing imitations. It prevents contagious abortion and other diseases, cures all sores, scratches, skin diseases, hoof ailments, etc. NO LICE in poultry house or any place it is sprayed. Beware of imitations that last only a few hours and make sores. If your dealer does not keep Shoo-Fly (made in Philadelphia, Pa.,) send us $1.00 for latest Improved Three Tube Sprayer and enough Shoo-Fly to protect 200 cows Cash returned if cows are not protected.
SHOO-FLY MF'G. CO. 1005 Fairmount Ave., Phila., Pa.
EDITOR knows from experience Shoo-Fly is O. K.

CARPENTER-MORTON COMPANY,
Boston, Mass., U. S. A.

Fat in Milk and Cream.

What difference, if any, do you make in 100 lbs. of butter fat delivered in milk, part of such being 24 hours old, te t 4%, and 100 lbs. butter fat delivered in cream testing 22½? P. K.
Cleghorn, Eau Claire Co., Wis.

One hundred pounds of butter fat would be equal to 2,500 lbs. of 4 per cent milk. In separating and churning this milk there would be a loss of 4.5 lbs. of fat and the average yield of butter would be 116⅔ lbs. with ⅙ overrun. One hundred pounds of butter fat in the form of 22.5 per cent cream would be equal to 444 lbs. cream. The loss in churning would be 0.7 lbs. and the butter fat would make 118 lbs. of butter. A hundred pounds of fat in the form of cream is worth from 2 to 3 per cent more than the same fat in the form of milk, on account of the loss of fat in the skim milk.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Barrenness.

I have a Jersey cow has only had one calf. She was very hard to get with calf the first time, going to different bulls 12 or 15 times. I have been having her served every month for the last year and am unable to get her with calf again. I had the neck of the womb opened and bred at once, but it was with the same results.
Dalton, Ga. J. B.

ANSWER.

Your cow has an unnatural condition of the organs of generation, which requires a personal examination, by a qualified veterinarian.

Foot Rot.

We have been having some trouble with our cows being lame. In the winter one cow got very lame in her front foot. We applied kerosene after thoroughly washing, and she came out all right. The trouble seems to start well up between the hoofs, and the foot looks raw and inflamed; the second case gathered and broke and has left the joint enlarged and stiff, and has almost ruined the cow. About two weeks ago another cow was taken. We applied kerosene.
Springport, Mich. L. E. L.

ANSWER.

This trouble is most prevalent in wet seasons, due to dirt and filth gathering between the claws, or walking through serrated grass, which causes wounds and sloughing. Pare the hoof, so that it will not retain any dirt or filth; wash the parts clean, and dust over the wounds, calomel full strength; over this apply a warm linseed poultice, and change twice daily until the swelling has disappeared. If animals are hard to handle, you may stand them in a solution of an antiseptic dip, from 15 minutes to half an hour, daily. See ad. in DAIRYMAN for dip.

Hen Lice.

We have a big barn on the farm with a plank floor, which is badly overrun with chicken lice. How can we kill lice on horses? C. de B.
Worthington, Minn.

ANSWER.

Mix in each bucket of whitewash one dram of corrosive sublimate, and whitewash the walls and ceiling of barn and hen-house; cover the floor with a thin layer of slacked lime.

Hen lice will not live on horses for any length of time. But you must never allow the hens to roost in the barn. It is also advisable to have a box of lime or ashes in the hen house for the hens to scratch in.

Skin Disease.

My cow has a skin disease on her udder and belly, of about a week's standing. The skin is rough and about three times its usual thickness, it being hard to bend, is not sensitive.

In two or three places just back of forward legs there oozes out a thin, corn colored liquid resembling a mixture of blood and water. M. A. V.
Hastings, Mich.

ANSWER.

Wash the parts clean with soap and warm water and apply a 4% solution of carbolic acid, twice daily, and give, the cow ½ oz. of Donovan's Solution in food, twice daily.

Warts on Teats.

Several of my cows have so many warts on their teats as to seriously interfere with milking. Those between the ages of two and four years seem to be affected most. E. W. McC.
Callao, Mo.

ANSWER.

See page 497, last issue.

Polks.

Please give me a cure for polks. J. H. W.
Pleasant Hill, Ore.

ANSWER.

Please give us symptoms of trouble and tell us what you mean by polks.

Failure to Come in Heat.

Have two cows that have failed to come in heat; fresh about April 1st. Will they come all right? Are in healthy condition; good pasture.
Chambersburg, Pa. A. H. B.

ANSWER.

It is possible that the cows are coming in heat at their regular periods, but you fail to notice them. If the bull accompanies them, they may be with calf.

Hole in Teat.

I have a cow with a hole in the side of her teat. Could you give me the analysis of peas and oat hay cut when the grain is in the milk. SUBSCRIBER.
Victoria, B. C.

ANSWER.

The opening might have been closed when it was fresh, with a stitch, or two. But if the trouble is of long standing, it is best to operate on her, when she is dry. Employ a qualified veterinarian.

(The doctor seems to have assumed that the hole in the side of the teat was caused from some laceration. Sometimes, however, conditions of this character are met with when there has been no accident, the hole being in fact, as it were, a rudimentary teat. In cases of this kind, when the cow is dry scarify the edges of the hole, with a knife or scissors or hot iron, bring them together with adhesive plaster and the wound in healing will close the opening.

Oat and pea hay is credited with 9.2 per cent digestible protein, 36.8 digestible carbohydrates and 1.2 per cent digestible fat.—Office Ed.)

Loss of Tails.

We have two cows who have lost the use of their tails. D. M.
Zanesville, O.

ANSWER.

It is necessary to have more of the history of your case in order to find the cause and offer a remedy.

Prolapsus of Vagina.

I have a cow that is troubled with what I suppose is inversion of the vagina. Sometimes a hard sack apparently full of water portrudes through the opening, and when I go to replace it she strains to make water, but cannot until it is pushed back.
Saginaw, Mich. E. W. M.

ANSWER.

The protruded parts may be replaced by hand, and the floor raised so that the cow stands at least six inches higher behind than in front. Give less bulky food so that the abdomen will not be overdistended, and press against the foetus. The trouble will subside when the calf is delivered. It will not interfere with parturition.

Horse Owners! Use
GOMBAULT'S

Caustic Balsam
A Safe, Speedy, and Positive Cure
The safest, Best BLISTER ever used. Takes the place of all liniaments for mild or severe action. Removes all Bunches or Blemishes from Horses and Cattle, SUPERSEDES ALL CAUTERY OR FIRING. *Impossible to produce scar or blemish.* Every bottle sold is warranted to give satisfaction. DR. HAYES, Buffalo, N. Y.

Our New Patent
and Great sales are the talk of all who know of them. A fortune has been made by the patentee and the farmer in a short time. For seven months the sales were over $350 00 per day. Something good can't be gotten for nothing. By putting $500.00 and upwards into this business it will be the best paying investment we know of. Farmers using the machine say that they would not do without it for two, three, and ten times the price. Common farmer can handle it in a very paying way. We can prove the great selling qualities of this machine by bank account, the bankers themselves, and the farmer. Our plan is fair and honest. Best bank references. Car fare one way will be paid to responsible men whether they invest or not. Address

Preservatives in the Cheese Vat—Starters.

ED. HOARD'S DAIRYMAN:—Can you tell me if the milk Preservaline that is on the market will keep milk sweet for cheese making, that is, if the Preservaline is put in the milk before the rennet? While the curd is usually all right the whey is too sour when boiled to raise the pot cheese. If it could be kept sweet two hours longer the cheese maker would have no further trouble.

Can good butter be made this hot weather without a starter, or is it absolutely necessary in order to make extras to keep to the starter. F. B.

Mongaup Valley, N. Y.

A cheese maker who uses preservatives in his milk is laying up much trouble for himself. The process of manufacturing cheese is a series of changes in the milk, brought on through the action of bacteria. Preservatives stop the action of all bacteria and the ripening of the curd and milk does not take place, and a raw curd and non-curing cheese is the results. We know nothing about local conveniences, but consider that if the whey was started heating as soon as drawn, it would obviate the trouble of rapid souring. If the whey was heated to 125 or 130, it would not kill the germs, but would keep them from growing and producing more acid. As to whether a starter should be used will depend on the quality of the milk. If it is clean, extras can be easily made, but as but little clean milk is brought to creameries during the summer months it is advisable to use a starter.

DON'T PUT OFF

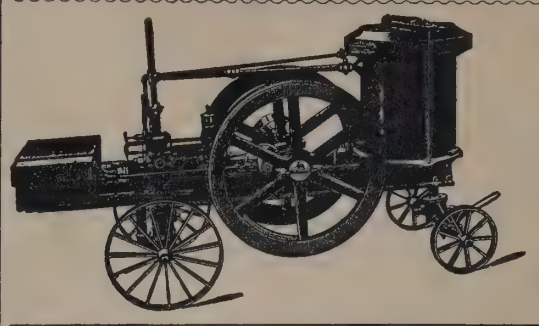
Seeing your friends and having them join in for a good club of subscribers.

Wisconsin Buttermakers' Association.

ED. HOARD'S DAIRYMAN:—The Executive Board of the Wisconsin Buttermakers' Association held a meeting in Madison on June 27th. Professor E. H. Farrington was appointed to fill the vacancy on the Executive Committee, caused by the resignation of Mr. G. B. Winsor, who has left the state.

The Association was enabled to secure an appropriation of only $500.00 per year from the state, by the action of the last legislature. The officers will try and get as good results with this small allowance, as possible.

The date of the next convention was discussed, and it was decided to hold the next annual meeting on the first Tuesday, Wednesday and Thursday of February 1904. The place of holding the convention will be decided later, as there are several conditions to consider, and there are at least three cities that desire the meeting.



The report of the last convention will be mailed to the members before long. The printing of the same has been delayed by the stenographer who was employed during the convention at Waukesha. F. B. FULMER, Sec'y.

Let Them Help Themselves.

They'll not take too much, and they'll get it as they want it. Don't force animals to eat salt when they don't require it, by mixing with food.

COMPRESSED

Pure-Salt Bricks

are all salt, no impurities. Improve the quality and yield of milk. A modern convenience, always present, animals never neglected, and costs for each only about a nickle a month. See how they enjoy helping themselves when you place it within reach. For all stock. Buy of dealers or send for free booklet to

Belmont Stable Supply Co., Brooklyn, N.Y.

A CHANCE TO MAKE MONEY

I have berries, grapes and peaches a year old, fresh as when picked. I used the California Cold Process. Do not heat or seal the fruit, just put it up cold, keeps perfectly fresh, and costs almost nothing; can put up a bushel in 10 minutes. Last year I sold directions to over 120 families in one week; anyone will pay a dollar for directions when they see the beautiful samples of fruit. As there are many people poor like myself, I consider it my duty to give my experience to such and feel confident anyone can make one or two hundred dollars round home in a few days. I will mail sample of fruit and full directions to any of your readers for nineteen (19) 2-cent stamps, which is only the actual cost of the samples, postage, etc. FRANCIS CASEY, St. Louis, Mo.

Cutting and Curing Alfalfa.

ED. HOARD'S DAIRYMAN:—I see Mr. P. Clawson of Butler Co., O., has had a sorry time putting up his first cutting of alfalfa hay. Well, if we should put alfalfa up in Idaho as he did in Ohio, the result would be just the same. I have been putting up alfalfa for ten years and I never have been able to put up two crops alike, because I can't get all the conditions twice alike. What I mean by that is, the condition of the ground, whether it has just been watered or whether it is dry at time of cutting and that has very much to do with the condition of the alfalfa, and then the condition of the weather has everything to do with getting the crop up in good shape.

I don't like Mr. Clawson's sign for the proper time to commence cutting, he says: "Experience teaches me to cut it whenever it begins to turn yellow near the ground and drop the bottom leaves. Don't look for bloom if it will cut a swath." My observation is that when it begins to get yellow near the ground, it is a condition that is caused by other conditions. For instance, if the alfalfa is very thick and somewhat lodged and it is irrigated thoroughly and the weather is hot for a few days, it will not only get yellow but white near the ground. Celery would bleach under the same conditions.

It depends on what you want to feed alfalfa to as to when it wants to be cut. If one wants to feed it to his own cows for milk, it should be cut just as early the first time as it will cure well; but there is the trouble, we can't cure it as young in June as we can in September.

If we cut it before it blooms in June, it will most always cook rather than cure. So we usually let our first crop bloom before cutting, and feed it to horses and dry stock; but the second and third cuttings will cure out all right here, if cut before blooming. Mr. Clawson says that unless there is some other way to cure it besides in the cock or windrow, alfalfa will be a failure in the corn belt. My opinion is that there is only one other way, and that is in the silo.

Our best way to cure alfalfa is to rake as soon after cutting as we can gather clean; let it settle half a day in the windrow and then take a fork and bunch by hand, by putting three mower swaths in a bunch. Of course that depends on the size of the windrow, on how much hay one puts in a bunch. We put enough in a bunch so that a man can take it all up clean at one forkful when hauling. In this way, if it gets over dry before stacking, it will not waste very much.

I am perfectly aware that there are as many theories about cutting, curing and stacking alfalfa as there are men who grow it; so that what I have said can all be set aside, if it don't suit the fancy of any man who grows alfalfa.

HOW'S YOUR BROOD SOWS THIS YEAR?

HAMBURG, IOWA, Jan. 23, 1903.
International Stock Food Co., Minneapolis, Minn.

DEAR SIRS:—The **"International Stock Food"** which I have been using for two years has proven entirely satisfactory. I fed it to my brood sows before and after farrowing and it gave excellent results. I gave it a good test on some shoats last fall. Three of the **smallest** were placed by themselves and fed two measures of **"International Stock Food"** three times **every day.** The other lot was fed **"International Stock Food"** three times per week and all had same feed and water. At end of 60 days the three weighed 20 pounds apiece more than the others. Respectfully,
W. J. WOODLAND, Breeder Duroc-Jersey Hogs.

☞We Have Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine and Unsolicited.☜

We own "International Stock Food Farm," which is located 12 miles from Minneapolis and contains 650 acres. We feed **"International Stock Food"** every day to all our WORLD CHAMPION STALLIONS, DAN PATCH 1:59 ¾ and DIRECTUM 2:05¼; to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. "INTERNATIONAL STOCK FOOD" ☞3 FEEDS FOR ONE CENT☜ is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human system. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these Medicines promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High-Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Fifty Thousand Dealers throughout the World. ☞Your Money will be Promptly Refunded in Any case of failure. It will make your Calves or Pigs grow Amazingly and has the largest sale in the World for keeping them healthy. ☞Beware of the many Cheap and Inferior Imitations. No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or a Falsifier.

CLIMAX

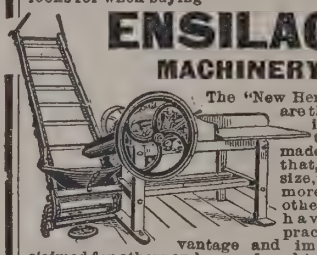
Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.



WARSAW-WILKINSON CO., WARSAW, N. Y.

"NEW HERO"

excels in strength and effective working qualities and sells at a price that "fits the purse." It is the combination of these three features in the highest possible degree which a practical man looks for when buying

ENSILAGE MACHINERY.

The "New Hero" Cutters are the simplest in construction of any made; so strong that, size for size, they weigh more than any others; they have every practical advantage and improvement claimed for others and many found in no other; they are guaranteed to outlast and outwork others. Sizes, 9 in. to 26 in.; with or without self-feed table; shredder attachment if desired; swivel feed carrier. We make also a complete line of sweep and tread horse powers, shellers, huskers, feed grinders, wood saws, windmills, etc. Remember that Appleton quality is the standard of excellence, and write to-day for free catalog.

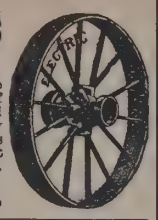
The Difference Sells It

The agent has no trouble in selling the **Sharples Tubular Hand Separator** after he once has a chance to show a customer



the difference between the **Tubular** and the old style "bucket bowl" machines. There are at least a dozen of the "bucket bowl" separators, all with different names, but all about alike; some with horse radish grater insides, some with cones, some with discs; all of them complicated, and hard to clean, and not much choice. There is but one **Tubular** and it is entirely different from other separators. Just notice the difference in the low down supply can of the **Tubular** as compared with other separators. Examine the small diameter, light simple bowl of the **Tubular**, so easy to clean. Take hold of the crank and see how much easier the **Tubular** turns than other separators. Don't overlook the automatic oiling device by means of which the **Tubular** is oiled; you don't find it on other separators. After all this take the Babcock test and see how much closer the **Tubular** skims than other separators.

If you want to know a lot more of the difference between the Tubular and other separators, write for Catalogue No. 144.

Wm. M. UNDERHILL, Oconto, Wis.

Estimating the Per Cent of Fat in Milk from Yield of Butter.

ED. HOARD'S DAIRYMAN:—Will you be good enough to peruse the following and say if my method of arriving at a test for butter fat, in the absence of a Babcock tester, is sound? I have carefully ascertained the yield of butter from 300 lbs. of milk which I find is 13.125 lbs., this result was obtained from the mixed milk of 20 cows and taken in three tests of 100 lbs., each at intervals of 7 days, the milk in each case was passed through a De-Laval separator and churned. My cows are all natives, stall fed and in various stages of lactation, yielding 7 lbs. (from cows drying up) to 35 lbs. daily (in full milk.) The average daily yield of 20 cows now milking, is about 300 lbs. Daily ration about 100 lbs. of fresh cut green grass (Guinea grass) supplemented with grain feed averaging 5 lbs. per head divided in two feeds. Having ascertained the yield of butter to be 13.125 lbs. from the 300 lbs. of milk I have deducted the ⅛ overrun on butter fat which is the allowance I see named in the communication on page 320 of No. 14 HOARD'S DAIRYMAN. The proportion will therefore be:

Butter fat	11.667
Overrun	1.458
Butter	13.125

For comparison I have taken the summer dairy test of 11 cows by the University of Illinois and Maid Cloverdales record, reported on pages 316 and 317 of the same number.

	Total milk for one week.	*Average per cent of fat.*	*Total butter fat.*
Illinois test (11 cows	1567.2 lbs.	3.43	53.77 lbs.
Maid Cloverdale's record	334.7 lbs 1 week	2.99	10.022 lbs
Lyndhurst dairy Jamica, W.I.	300 lbs.	3.88	11.667 lbs

In this Island of perpetual sunshine, 2000 miles south of your State, the mean temperature is about 80° all the year round; our conditions of dairying must necessarily differ widely from yours but at the same, time the main principles are the same and it will be interesting to us to be able to make a comparison with the average northern dairies in order to ascertain the relative value of our feeds and feeding. A. H. PINNOCK.

Jamica, W. I.

In the nature of things, HOARD'S DAIRYMAN cannot have very many readers in the West India Islands, for the very good reason that dairying is not a common industry there, not to say a leading industry. It is fair to say, however, that the deficiency in number is somewhat compensated for in the zeal and intelligence of those who do make dairying more or less of a specialty. Unless we are greatly mistaken, therefore, the tens of thousands of dairy readers elsewhere will take a lively interest in the above.

Answering the specific inquiry submitted by him, we may say that his figures appear to be correct, assuming that the over-run does not exceed one-eighth, and this is probably as much as the general run of creameries can be expected to average. However, where conditions are all at the best, an overrun of one-sixth is quite possible, and therefore, this is the factor usually employed for estimating the butter product of a cow from the test of her milk. In other words, to ascertain the amount of butter a cow is capable of making, we add one-sixth to the amount of fat in her milk, and, therefore, if it was required to estimate the per cent of fat in the milk, we would deduct one-seventh from the total yield of butter.

Measuring Cream for Test.

Our creamery man measures the cream in a pipette and tests it once a week. It tests about 25 per cent. Are we losing, and how much?
Martintown, Wis. H. M. W.

We can't say as to how much loss there would be in testing cream by measuring with the pipette, as much depends on its physical condition. But that there is a loss there is little doubt. Cream should always be weighed for testing, and this especially so in consideration of the fact that the Wisconsin Legislature, last session, passed a law requiring that for testing cream the samples should always be weighed.

The Care of Blankets.

Never let blankets remain in service after they are soiled; dirt rots the fiber and invites moths. Because of the peculiar saw-tooth formation of wool hair it is necessary that a pure soap, made of the best materials, be used; a cheap soap, especially one which contains rosin, will cause the blanket to become hard by matting the fiber.

To Wash Blankets and Retain their Softness.

Dissolve shavings of Ivory Soap in boiling water, add cold water until nearly lukewarm. Immerse a blanket and knead with the hands; rinse in clean warm water in which also some Ivory Soap has been dissolved. Dry in a place that is neither very warm nor very cold.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56. Includes postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on lable is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office orExpress Order (never by personal check), addressing Hoard's Dairyman, Fort Atkinson, Wis.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

Entered at Fort Atkinson, Wisconsin, as second-class matter.

A Vermont Dairy Barn.

Ed. Hoard's Dairyman:—I have mailed you to-day a photograph of our round barn. It is not completed so I cannot send you a completed photograph yet, but will as soon as done. I will commence at the bottom and give you a description as near as I can and the photograph will show you how it is constructed.

Our concrete wall is 85 ft. in diameter and one in center of barn 20 ft. in diameter, 18 inches thick. The silo rests on this and is 60 ft. deep; hooped with wood hoops 6 inches wide and 6 inches thick at bottom, resting on wall and out side of silo studs and we have 122 studs, 3×6, 8 ft. long set on this hoop and another hoop of same size on top of these studs and our floor joists 3×10×32½ and 122 of them rest on this hoop and our floor comes on top of these joist.

We can stable 75 cows, having a feed alley 17 ft. wide, then comes the cows, 6½ ft. for cows and manger, then an 8 inch deep trench and 18 inches wide and the balance of room for a walk and for a manure carrier which will run overhead and carry the manure out into a manure house or dump into wagons. There will be three feed holes close to silo from floor above.

At the entrance of the barn above, we have a building 12×20 where we drive in, using 13 ft. for driveway and the balance for a gas engine for cutting corn, threshing and running cream separator. Under this part, we have a milk room 12×20 and can strain the milk in the stable and run it into the milk room.

As we drive into the barn we go directly to silo and around it and out. Have a bay for hay and grain, 25 ft. deep and 257 ft. around on outside. There will not be a stick of timber in the barn outside of silo. It is 22 ft. from sill to plate and the first rafters are 30 ft. long up to the hip, and it is 170 ft. around at hip. Here we have a round track and carrier for unloading hay. Our second rafters are 34 ft., running to peak of barn; there are 8 of them, the balance of rafters rest on silo plate and the cupola is 16 ft. in diameter and 11 ft. to plate with a hip roof on it the same as the barn. Our ventilators will be carried up into cupola where there are three lattice windows. I shall not complete the stable till after haying and harvesting, and I expect now to use the McLery stall made at Palmyra, Wis. and I will give you a photo of the barn as soon as completed.

Grand Isle, Vt. E. J. Parker.

The Horse's Teeth as Evidence of the Age After Eight Years.

Ed. Hoard's Dairyman:—After the age of eight years, the evidence which is afforded by the wear of the incisor teeth is much less definite and trustworthy than it is prior to that age, and an opinion has to be based on general observation, and in any case is not supposed to be absolutely accurate. The expression "about nine," or nine or ten years old, will be used very frequently, and sometimes a good judge will decline to be limited to a year or two in cases where the condition of the incisor teeth indicates that they have been subjected to exceptional wear from crib biting or some other cause.

At nine years old the marks in the central incisors, which at eight years are triangular, become more rounded in form, and are nearer the posterior boundaries of the teeth. The corner incisors are still more square than they were a year before, and the tusk is conical and blunted.

At ten years old the marks in the central incisors are commonly reduced to small round spots, and are quite close to the posterior edges of the teeth, which are beginning to assume the triangular form.

As a matter of fact only the upper corner incisors need be consulted for evidence of age, from ten to thirty, and the only mark to be looked for is a dark line or groove which commences to appear on the outer surface of each top corner incisor immediately below the gum, at ten years of age.

Careful observation of the upper corner incisors at ten years old will reveal the presence of a slight depression extending from the edge of the gum downwards about an eighth of an inch. This depression is really the end of a groove which exists in the fang of the tooth, and it is brought into view by the growth of the tooth, and the decrease in the depths of the alveolar cavity in which the tooth is lodged. As these processes go on, year by year more of the groove is seen, while the constant wear of the cutting surfaces of the incisors bring them nearer to the groove, and in about eleven years from its first appearance, it reaches from the gum to the cutting edges of the incisors. At the same time it will be seen by a close inspection of the top of the incisor close to the gum, that the groove is at an end; there is, in fact, no more of it to appear. The further growth of the tooth will expose the perfectly smooth surface of the fang and the combined effects of the wear at the bottom and the growth from the top will finally lead to the obliteration of the groove entirely.

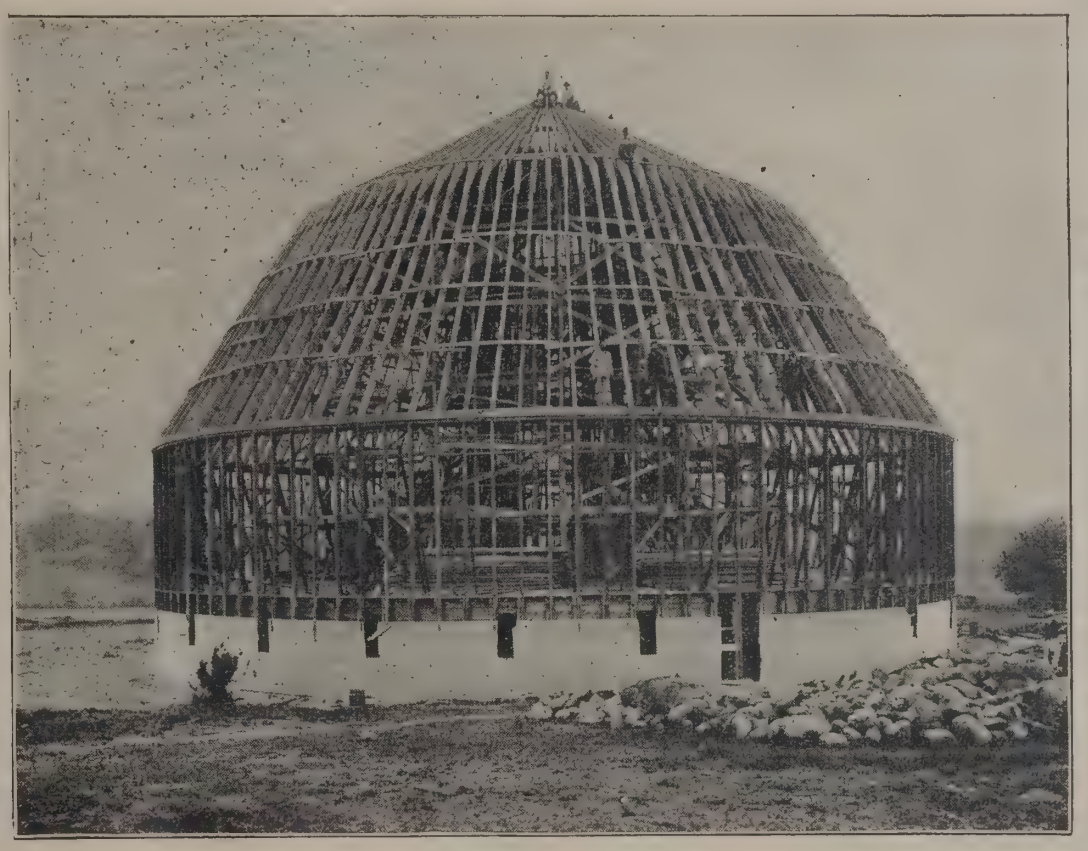
This system is really the only method of judging the age above ten years, worthy of consideration. But it is quite certain that to use the system effectively experience on an extensive scale is necessary. Clearly, success depends entirely on keen observation of the condition of the groove in the corner incisors in reference to the gum at the top of the tooth, and the cutting surface at the bottom. The whole length of the tooth must be mapped out in imagination, and a certain length of groove marked for every year, thus allowing ten years for the groove to reach the whole length of the tooth. The fact of it having reached the middle of the tooth will be evidence that the age is about fifteen or sixteen. If the tooth be divided into four equal parts, the extension of the groove to the first line will mean between twelve and thirteen, and to the third line, between seventeen and eighteen years of age.

In adopting the foregoing descriptive method, the observer is left to exercise his ingenuity, and it is a very interesting inquiry when an aged horse whose age is known to the owner comes under observation.

It will be seen that no special skill is required in the application of this test. It is not necessary to secure the horse in any way, or even to open his mouth. The corner of the upper lip must be raised sufficiently to bring the top corner incisor into view. The rest is a mere matter of calculation.

When the groove has reached the bottom of the incisors, and the horse has attained the ripe age of twenty-one years, future observation must be directed to the top of the groove, viz.: the end nearest the gum, and the measurement now must relate to the distance between the gum and the top of the groove. Certain exceptions to the normal development of the teeth, and some irregularities and accidents may be expected to occur during the periods of temporary and permanent dentition,and from time to time various degrees of constitutional disturbance will be observed,which are, however, invariably referred to other causes, or left without any explanation. The process of "teething" in the human being, is always estimated as having an important bearing on the health of the sufferer; but there is a novelty in the idea that horses or others of the lower animals,experience any inconveniences from the eruption of, or changes in, the teeth, although it is known that these changes take place on a much more extensive scale than they do in the higher animal.

During the third year of a horse's life twelve new teeth, eight molars and four incisors are cut, and in the course of the fourth year there are sixteen new teeth, four incisors, eight molars, and four tusks which are all advancing at the same time, causing, as a matter of necessity, considerable irritation, and requiring more attention than is ever given during these periods.



It is surprising that no investigation has been made into the diseases which are incidental to the process of teething in the horse, and it is not, therefore, possible to refer to any specified disorders which are met with during the third and fourth years; but irregular appetite. refusal of certain kinds of food, dropping half masticated food ("quidding") from the mouth, cough and sore throat, "lampas," and general loss of condition may quite consistently be referred to irritation and fever induced by cutting the teeth.

Disease in the structure of the teeth, so common in man, is rare in the horse, but not unknown to the observant veterinarian who has looked for it. Injury to the fang of a molar in the bottom jaw has led to the formation of alveolar abscess which has defied all kinds of treatment, because the real nature of the disorder has not been suspected, and a dead tooth has been allowed to remain in its cavity.

One of the most disastrous accidents which can happen to a horse's teeth is the loss of one of the molars from any cause, when the occurence has not been observed. The result is the growth of the tooth which formerly came in regular contact with the absent one, but it is now unchecked by any persistent pressure, and therefore continues to grow until it prevents proper closure of the mouth and renders mastication impossible.

The real difficulty in regard to dental irregularities is the frequent absence of any suspicion on the part of the owner of the horse out of condition, as to the cause of the derangement being in any way connected with the teeth, and his consequent neglect to call inveterinary assistance.

A VERMONT DAIRY BARN.

Built by E. J. Parker, Grand Isle, Vt.

Handling Bad Bulls.

Ed. Hoard's Dairyman: — In your valuable paper of June 26th we read the inquiry made by T. F. V., concerning handling bad bulls. This is well answered and yet opens a wide field for inquiries as this gentleman, though a carpenter, is a pretty fair dairyman, making a net profit of $100 per cow. We need that carpenter in Humboldt county badly. We have a two-to-one better dairy country than where this carpenter lives, yet seldom do our dairymen average above $70 net to the cow.

We better quit talking profits though, and talk bull. Several men went to cemetery hill by the bull route in this county. The first and the last ones we will mention as a sort of example: J. B. Tilly, a lover of good blood, sent east for a Jersey blooded bull. He was a monster and a beauty; gentle as a kitten. A man whose work took him through the bull's pasture often, took an apple for the bull. One day he did not have the apple. The bull remonstrated; a quarrel ensued; the man was killed. Before dying Mr. Tilly asked the man if he had better shoot the bull. The man answered: "No. It was my fault." The bull never showed any dangerous proclivities after; lived ten years after, raising some great cows.

The last bull was a Jersey scrub, not fit to turn loose over night in the Sahara desert. Patrick Kelly was the gentleman's name. It got to be a by-word at the creamery, "Who is ahead this week,

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

DEATH OF A. H. BARBER.

In the death of A. H. Barber of Chicago, which occured at his residence in that city July 8th, the dairymen of the central north-west are deprived of a steadfast friend of many years service. He was in active business as a commission merchant and manufacturer of dairy goods for more than thirty years and by his ability and integrity won and retained the confidence and esteem of a wide circle of patrons and customers. In former years he was a frequent attendant at dairy conventions, where his genial nature and thorough knowledge of the market demands for dairy products made him not only a welcome guest but a much appreciated consellor.

The Editors of HOARD'S DAIRYMAN account his death a personal loss and claim a share in the sorrow which falls so heavily upon his family and those more directly connected with him in social and business relations.

WHO shall say in the future that the spirit of agricultural progress is not abroad in the South. The state of Mississippi has appropriated two mlllions of dollars for the promotion of Agricultural education among her farmers. The Senior Editor of the DAIRYMAN recalls with much pleasure the fact, that he has been favored in the past fifteen years with the privilige of attending four large Agricultural Conventions in that state, two at Jackson and two at Vicksburg. In everyone of these conventions he was impressed with the splendid mentality of the men and women who composed them. Where the people of a state are mentally hospitabel and welcome the truths of science and investigation with the purpose of making them their own, there thought, progress and prosperity will abide.

"RURAL School Agriculture, Bulletin No. 1, University of Minnesota, St. Anthony Park, Minnesota. Price 60c, or in lots of five or more, 50c, carriage prepaid."

This bulletin is a unique attempt to place in the hands of the rural school teacher detailed plans for leading the country pupils to study the things of the farm and the farm home, It was edited by Messrs. Hays, Robertson and Wojta, but was in part written by other members of the faculty of the Minnesota Agricultural College.

It coutains 237 exercises to be carried out by the pupils. Each exercise is complete in itself. It gives the object to be sought, the materials to be used, and the plan in detail which the teacher is to have the pupil carry out in doing the work of each experiment, The materials required are such as may be available at the school, or in the farm home, and it is this feature of clear and familiar illustration and explanation that makes this little book especially valuable. It will help every farmer and farm boy in the land.

THE GOOD FEEDER.

Take the patrons of any creamery and note those who carry away the largest checks for milk. Is it always those who have the largest number of cows? By no means. It is a very instructive thing to look over the milk sheet of a morning, and see what these different farmers are doing. It is a pity that the farmers themselves do not have a chance to do the same looking. If they could see for themselves just what the facts are, as between man and man, it would cure some of them of their foolish conceit. Our "Patron Investigation" has been stripping the cover off a little.

But this thing is true of every successful patron without fail:—*He is a good feeder*. Of course his good sense impels him to have a good cow to feed his stuff to, but that is only half of the proposition,and he knows it.

SHORT-HORNS AT ST. LOUIS NEXT YEAR.

We are very glad to learn that the Short-horn Breeders' Association has decided to enter the contest at St. Louis next year. Mr. H. H. Hinds of Stanton, Michigan, has been engaged to take charge of the Short-Horn herd during the Exposition. He had charge of the Short-Horns at Chicago in '93, and not a little of the credit earned by the Short-Horns at that Exposition was due to Mr. Hinds' careful attention.

It is probable, of course, that the Shorthorns will be entered in class C, which is to consist of cows entered for demonstrating all the products of the cow; namely beef and milk, with their calves judged for beef merits. The awards in this class will be based upon a scale of 40 points for the dairy performance of the cow, 35 points for beef conformation and gain in live weight during the demonstration, and 25 points on the quality and growth of the calf as a prospective butcher's beast.

The American Short-Horn Breeders' Association will bear all the expense of the demonstation made by Short-Horn men. All the owner of the cow will have to do will be to furnish the cow. The association will pay the freight to the exposition and return, and bear all the expenses during the demonstration. The association will also furnish suitable prizes for Short-Horn breeders who participate in the demonstration, which will be given in addition to the prizes awarded by the management ot the exposition. Short-Horn breeders desiring to participate in this test are requested to at once put themselves in communication with Secretary John W. Groves, Union Stock Yards, Chicago.

HOW TO KNOW A THING.

Certain farmers know how to do all ordinary dairy work. They have learned how by doing it from childhood. But they have never taken the trouble to know the *why* or make themselves acquainted with the underlying principles that govern the thing they are doing. As a natural consequence they never do the thing as well as it ought to be done, because they are not guided by a knowledge of the governing principle. A man tending a steam engine, who knows nothing of the laws and principles which govern the action of steam, is on the same footing with the farmer who is dealing with soils, plants, animals, stables and milk, and knows nothing of the principles which govern these several important things.

James W. Young of Tennessee says truly and well:

"It is not only necessary to know a thing, but to know it well and know the reasons for it. To know the reason helps wonderfully. A man then works with *intelligence*."

Ride through the country anywhere and you can pick out the farm at a glance, where the owner is a man of intelligence, one who studies to know the why and wherefore of the thing he is doing. In nothing is this kind of study more needed than in dairying where all are constantly dealing with the deeply hidden laws of animal life, maternity, bacterial action, sanitary laws, etc.

Very much of dairy farming is done as the Irishman said he played the violin. He was asked if he played by note. 'Divil a note," was the reply. "Do you play by ear?" "Divil an ear." "How, then, do you play?" "By main strength, begorra," was the answer. Suppose he had been asked if he did not think it would be better for him to learn to play by note and had replied: "I don't want any book music in mine," would he not have been in the same company as the dairy farmer is, who despises what he calls "book farming?"

A SIGNIFICANT CONTRAST.

As is well understood HOARD'S DAIRYMAN believes strongly in certain cardinal principals connected with dairy farming. Its editors and its most successful contributors follow those cardinal principles closely and faithfully in the conduct of their dairy farms. For instance, there is the great cardinal principle of a specially bred dairy cow for the dairy farm. The DAIRYMAN does not advocate any special breed, but it does insist that no dairy farmer can afford to breed his cows for any other purpose than the largest profit at the pail. It believes that when any other purpose comes in between the pail and the farmer, like that of beef, for instance, it results finally in lowering the best profit of the herd. It also muddles and confuses the intelligence of the farmer on the question of true dairy breeding. It takes him from the main highway and sets him down on a back cross-road. Dual-purpose breeding ideas end, finally, in scrub cows, lessened profits at the pail, and a down grade generally for the dairy farmer.

Go where we may throughout the land, we rarely, if ever, find first-class progressive dairy farmers, men who make the largest profits and do the best work, carrying on their business with dual-purpose herds. The great general rule everywhere is the true dairy bred cow for the first-class dairy farmer.

The dual-purpose cow is the result of a false idea of economy. The farmer who breeds cows with that idea and purpose, has left the main road. He has gone off after false gods. He puts a minor question—that of meat—in front of the major question—that of the highest profit in milk. Here is an illustration among the many thousands the creamery districts can show:

At Mondovi, Wis., are two creamery patrons among many others, Mr. Joseph Weller with a herd of twenty dual-purpose cows, and they are considered good ones at that. The other is a herd of 20 registered and high grade Jersey cows, owned by Walter L. Houser.

The Mondovi *Herald* states that for the month of June last, Mr. Weller received from the creamery, a check for $91.43, for the earnings of his 20 dual-purpose cows, at the pail. For the same month Mr. Houser received from the creamery for his 20 special dairy-purpose cows, a fraction over $169.00. Then comes besides,the earnings of either herd in the skim milk. That largely depends on the wit and wisdom of the man behind the cow, but it is hardly reasonable to suppose that the Weller herd earned any more from the skim milk than did the Houser herd.

Now here we have the question brought down to simple farm and creamery conditions. Which herd of cows is the most profitable for the dairy farmer? Which will earn the largest profit at the end of the year? Which system of breeding will give us the best cows for future work? Which of these two breeds of cows is the most economical in their work, taking the same food and turning out at the pail the largest net profit?

These are the questions that should govern. No man can afford to keep a class of cows for creamery work, that will end in producing such a difference as we see here. Be it remembered too, that the Houser herd received no grain; their sole food was grass, the same as the Weller herd. The difference in the earnings of the two herds for the single month of June, was $77.57. The expense of management, labor, etc., was the same. The difference in results, is due to the fact that Mr. Houser has held true to fixed principles, in his ideas of breeding a cow for the best profit in dairy farming.

One more question: How long will it take, at the rate the two herds are going, for Mr. Weller, with his more meat ideas, to catch up with Mr. Houser, with his more-milk-and-butter ideas?

CONCERNING MR. GROTE'S QUESTIONS AND COMMUNICATIONS.

Inasmuch as Mr. Grote insists that his questions have received unjust and unkind treatment by the editor, or sub-editor, of the DAIRYMAN, we can do no otherwise than print his communication in full, although, in our judgment it adds nothing whatever to the elucidation of the subject.

As the facts and figures for which Mr. Grote makes such insistent demand have been given over and over again in these columns, from year to year and month to month, as occasion arose, we have not found it necessary to tabulate and reprint them simply to convince Mr. Grote that the statements to which he takes exception are founded upon facts as well as upon reason.

Mr. Grote has evidently been a close reader of HOARD'S DAIRYMAN for many years, and he must therefore know that no paper has been more insistent, and no individuals more insistent, than HOARD'S DAIRYMAN and it editors, that the dairyman should raise on his farm, as far as he can profitably, the feed required for the proper maintenance of his cows and furnish them the raw material from to which to make milk in paying quantities; but we have never advocated the feeding of 40c oats when bran could be purchased at 20 dollars a ton or less. In other words,we have advocated that the farmer should exercise sound business judgment, and when he can exchange farm-grown feeds for commercial feeding stuffs at a profit, there is no reason why he should not do so. But Mr. Grote will search in vain for any statement direct or implied that the dairymen must of necessity depend upon purchased feeds to supplement farm grown roughage.

Many dairymen do depend upon purchased feed for this purpose. Some, because they believe they can obtain the necessary nutrients in this way, cheaper than they can raise them, and others, doubtless, without giving the problem, as connected with their own circumstances, careful investigation. This is true,probably,of every section of the country, and notably true, for example, of the Southern States, where the cow pea finds its

most congenial climatic conditions. The DAIRYMAN has called attention to this lack of forethought on the part of its Southern readers times without number, advising them over and over again that they should not depend, for example, upon cotton seed hulls for roughage, as so many of them do.

We beg to suggest to Mr. Grote that the burden of proof is upon him and not upon us. Speaking after the manner of lawyers, he indicts us, and then insists that we shall prove our innocence, whereas, the burden of proof rests upon him to show that we are guilty of the charge he brings against us.

In a way, in the communication which we print in this issue, he appears to accept this responsibility and submits several formulas for rations, but without any proof from experience by himself or others that rations compounded from these formulas would prove satisfactory.

If he has any evidence, for example, that 40 pounds of corn and cow pea silage, 10 pounds of fodder corn, and 10 pounds of alsike hay has ever proven a satisfactory and profitable ration, we shall be greatly obliged to have him submit it.

In making comparisons of the cost of the Illinois rations quoted and the formulas suggested by himself, Mr. Grote fails to note that in the Illinois rations, timothy hay is charged at $10 per ton, corn stover at $4 per ton, whereas he estimates fodder corn at $2 per ton, alsike hay at $4 per ton and corn stover and corn and cow pea silage each at $1 per ton. If he applied relatively the same prices that were used by our Illinois correspondent, the cost of his ration would be materially increased.

SACRIFICING THE MALE CALVES.

Speaking of the way dairy farmers sacrifice their calves to the veal market the *Breeder's Gazette* says:

If dairymen are as anxious to embark in the beef making industry as they are represented to be, it is difficult to understand why they persist in overcrowding the market with veal. This class of stock has sold recently from 50 cents to $1 below the range of prices a year ago, due to overloading the market. Things seem decidedly out of joint when such a complaint comes from the market place at a time when supplies for the feed lot are decidedly short. Doubtless some of the dairy calves now coming to market would not pay a profit on their feeding in ordinary years, but any calf, with average feeding capacity, should be able to show a profit if it can be kept growing nicely and turned toward laying on flesh. The supply of beef is already short enough, and for the matter of that it will soon be discovered, if it has not already been learned, that the number of dairy cows now in prospect is not sufficiently large to meet the needs of the next few years. There seems little philosophy or business sense in sacrificing a calf which promises to make either a fair beef or dairy animal.

In some particulars the *Gazette* is right and its criticism should apply to the farmers in those districts where butter is made. Where milk is produced for city consumption, or condensing purposes or for cheese making, very few calves are raised. Indeed it has become a noticeable fact that those districts that have the largest cow population, raise the fewest calves proportionately. It seems almost like a disgraceful thing to say, but it is true nevertheless, that not one dairy farmer in ten makes a serious study of the skim milk question, and the best methods of handling and feeding it. Neither will they make a serious study of the best methods of handling and raising calves. They don't seem to get it into their heads that a calf is a baby and needs the treatment and food that is fitted for babyhood. Sour skim milk is brought home from the creamery where no pains are taken to preserve it as fit food for calves, and the farmer dumps it into a sour, stinking barrel and feeds it from pails that are just as foul and reeking with harmful bacteria.

Did he but stop to think for one minute that this little bovine baby, if left with its mother, always gets its food in a perfectly pure, sweet condition, perfectly fitted for its baby stomach, he would see how wide of the mark all his methods are. As a consequence not one lot of calves in ten, even in our best dairy districts, will show right feeding and treatment. The farm separator will have to come, before the day of right calf feeding and raising is established.

There is no doubt whatever that if our dairy farmers would separate their milk on the farm and take the cream to the creamery, would build more silos, and grow a good supply of alfalfa, they could then easily carry four times the young stock on the farm that they now do. It is mighty poor economy and shows poor adaptation of methods, to sell a likely male calf for a dollar or so, when with a little study and good dairy intelligence, he could be turned as a steer at 15 months of age, at a good price and good profit. We have repeatedly made our skim milk worth 40 cents a hundred pounds by feeding it to calves, and grade calves at that.

Between what can be done in the way of good profit on the dairy farm, and what is done, is a mighty wide gap. Talk to the average farmer about closing this gap and he will tell you: "I don't want any book farming in mine." That is supposed to be a wonderfully wise answer, and his calves are specimens of the same wisdom.

THE MEANING OF THE WORD "SCIENCE."

A great many farmers get scared and draw themselves "into their holes," as the saying goes, the moment they hear the word "scientific" applied to any of the operations of farming.

It is hard to account for this prejudice or to say just what it means.

A great host of farmers have a strong prejudice against what they call "book farming," against what they call "scientific farming," against the professor and teacher in the Agricultural College, and against what is written in papers devoted to farming. No doubt all these books, papers and professors sometimes make mistakes, but is the farmer free from mistakes? No doubt the book or paper is not always "right down to bed rock" and "practical", but is the farmer always down to bed rock and practical?

It is a good thing in this world to start with a right definition. It acts like a chart to the navigator. One of the best definitions we have seen of what constitutes "science" in farming, is from "Campbell's Soil Culture." It says:

"The word "science" or "scientific" and its true application or meaning, is not generally well and clearly understood. Some seem to think it refers to something not intended for the common people and only to be enjoyed or recognized by our great scientists, such as astronomers, geologists, etc., but this is far from correct. It simply implies true or correct knowledge—to really understand a thing in its true and real sense. When a child comes to know mathematics from start to finish, he then becomes a scientist in the sense of a scientific mathematician. When a man learns how to husk corn so that he makes no false motions, every act or effort is directed to the best and quickest results and he is able to crib more corn from a field than any other man, he becomes a scientific corn husker, because he knows the best way to get the best and greatest possible results. So can the word be used in expressing a high degree of perfect knowledge in any subject we may consider, either in soil culture or any other branch of farm work, as well as bread-making and every other branch in domestic work.

There is one other point we wish to make and that is, a true scientist never reaches the point where he thinks he knows it all, but is ever reaching out for higher and more complete knowledge in and application of his special line, for in a close application to one line he becomes also a specialist. Thomas A. Edison, the great inventor, is a true example of both a scientist and specialist".

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

"I Can't Afford to Buy Stuff."

We were showing a bunch of young heifer calves to a neighbor, not long since, and he remarked: "How do you raise such nice calves?" We gave him our method, which was warm, fresh skim milk, right from the farm separator, twice a day, with a little blood meal mixed therein, a few oats and good pasture in summer, and alfalfa hay in winter. More than this we take great pains to keep the calves dry and clean.

He asked about the blood meal and we told him we purchased that of Armour & Co., and that we found it one of the finest feeds for young calves and pigs we had ever tried.

"Well" he said, "that may be all well enough for you, but I can't afford to buy stuff." We asked him how much more he would be willing to pay for the calves he saw before him, than he would for the ordinary run of calves, and he replied, "Oh, they are worth five dollars a head more."

Then we told him they had not consumed more than a dollar's worth each of the blood meal and oats, and asked would he be willing to give a dollar for five dollars?

The position taken by our neighbor is one quite common among dairy farmers. It is a mistaken idea of economy. The man would be willing to give five dollars more for our calves, but he would not pay out one dollar to make his own calves worth the same money.

There is altogether too much of this poverty-stricken notion among our farmers. It prevents them from owning good bulls, producing good cows, raising good calves, building good, healthy stables, and building silos. Many times it will make a farmer feed oats at $20 a ton, when he can sell his oats and buy good bran at $15. It warps the judgment and blinds the eye. He ought to be a free man; free to exercise the best judgment.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The Quotation Committee of the Elgin Board of Trade decided on 20 cents steady as the market price of butter,

There were no sales nor offerings. Resolutions concerning the death of A. H. Barber, of Chicago, were passed.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

When Corn Crop is Short What Shall go in the Silo.

My corn crop will be far short of filling the silo. Have plenty of good hay. Will it pay to fill the silo with it? A. E. R.
N. J.

It may do to put green clover in the silo if there is an over abundant crop, but we do not advise siloing timothy, red top or other grasses of similar character. Use the corn as far as it will fill and when winter comes feed sparingly, possibly not more than 20 pounds per day, and let well cured hay supply the balance of necessary roughage.

Construction of Hog Troughs.

Please publish plan of hog trough that will prevent the sows from dropping their excrement into the trough after eating. Have just lost two hogs, presumably from my hired help neglecting to clean the trough from excrement before feeding.
Quebec.

The only practicable system we have ever used in this connection, is to nail pieces of strong, hard wood across the top of the trough, say 16 inches apart. This interferes somewhat with the ease of cleaning the trough, but they will prevent the hogs from getting into the trough lengthwise, and also very considerably prevent fouling the same with excrement.

Moldy Cheese—Strong Cheese.

1. What is the cause of cheese moulding inside after being cut.
2. Why does some cheese become strong in much less time than other cheese? Or in other words the western cheese will not keep as long as the eastern and northern cheese. J. B. S.
Blockow, Mo.

1. Cheese molds when cut, on account of mold spores falling on the fresh, moist surface, and finding there a good seed bed and the proper material for their growth. It can sometimes be prevented by wrapping the cut cheese in a cloth, wet with alcohol or vinegar, and shutting it up in a jar.

The differences in the quality of the milk and the methods of making and storing account, for the cheese becoming strong. The geographical location of the cheese factory has nothing to do with the tendency of cheese to become strong. We have seen strong eastern cheese and mild western cheese and *vice versa*.

A Crib Silo.

Enclosed please find cut of crib silo. Please tell me through your paper what you think of it, and if it is practical to build as per cut. We can get hemlock much cheaper than white or yellow pine; the pieces would be 4 feet 9 inches long; spiked one spike each foot, and corners lapped and spiked. Would it hold? If so please tell us what you think about this plan. J. H. B.
Steamboat Rock, Iowa.

The diagram enclosed shows a 12-sided structure, and it is proposed to build it 18 feet in diameter and 30 feet high, made of 2×4 stuff, one laid upon the other, in the manner that bins in elevators are constructed. It is further proposed to cover the outside with number 2 stock boards and line the inside with number 2 white pine flooring.

There is no question but what this will make a strong and serviceable silo. In fact, it will be extra strong. The only question is as to durability, and this cannot be fully determined without trial. There is a chance that more or less of the moisture will penetrate the lining, and not having any ventilation, will cause it to decay and possibly communicate to the crib itself.

What Grain to Supplement Short Pasture

Will you kindly advise me what grains to purchase to supplement short pasture? Do not wish to feed any green feed as will need it all this winter. Our market affords corn meal, wheat bran, middlings, mixed wheat feed and gluten feed and meal. My cows are Jerseys and have freshened all along from January 1st until now.
Pierepont, N. Y. F. J. R.

Something, of course, will depend upon the character of the grass in the pasture and the amount of grazing that can be had. Ordinarily, the pasture grass contains an abundance of protein, and hence, the proper complement would be a feed containing only moderate amounts of protein. Ground corn would be most appropriate if it were not so concentrated. Ordinarily, we would recommend a mixture, half bran and half ground corn, the amount to be fed depending entirely upon the amount of nutriment furnished by the pasture and the ability of the cow to respond. If the pasture is pretty well dried up, affording but little protein, we should prefer to use gluten feed in place of the corn meal, or perhaps mixed wheat feed. Much, however, would depend upon the relative market prices of these products.

Ground corn contains 84.3% digestible nutrients; gluten feed, 80.1%; gluten meal, 78.9%; middlings, 73.4%; mixed wheat feed, 65.3; bran, 58%. This, of course, will enable this correspondent to determine which of the feeds named he can best afford to buy at the prices current in his market.

Cement or Wood Floors for Cows and Horses.

Which is the best floor for horses, a plank floor or a cement floor, and also for cows? What would it cost to lay a cement floor for a barn thirty-two (32) feet wide by fifty-four (54) feet long, that is for material, and how should it be laid? W. M.
Baraboo, Wis.

Opinions differ. The editors of this paper have never advocated the use of cement floors for either cows or horses. Under certain conditions, it is perhaps advisable to use a cement floor for cows, but never for horses. If used at all, there should be an abundance of bedding.

We must be excused from submitting estimates of cost, as the price of materials varies so widely in different localities. Prof. King, in his work entitled "Physics of Agriculture," gives the following estimate of the material required for 100 square feet of concrete floor four inches thick with one-half inch of facing: crushed rock 123 cubic yards, sand and gravel 73 cubic yards, cement 376 pounds. He adds: "Where crushed rock cannot be had, but gravel and plastering sand are available, a good floor can be made, but good cement must be used, using four of sand and gravel and one of cement."

Note and Comment.

Western Canada.—Creamery Conditions.—The Cow for the Country.—A Priest who Teaches Agriculture.—A Fine Outlook.

ED. HOARD'S DAIRYMAN:—Since I last commented and noted facts and fancies for "HOARD'S," the institute powers caught me up, and dropped me first in Hallock, Minn., on the very Manitoba line, once very far north, but now something like a gateway that lets one through into that vast British northwest, whose boundaries are not defined, more than it is more Red River valley for 1,500 miles away to the west and northwest, and of a most unknown northern boundary. It passes beyond the comprehension of an "easterner" to make comparisons out here. There is nothing out here to bound anything with, save some more of the same thing. It is dead level, away and away, prairie as far as you can see, and after an all-night's ride you look out in the morning to see again the scene of yesterday repeated all over. Winnepeg—old fort Garry of only forty years ago—is now a great wholesale city of 90,000 people, with every modern improvement of the age, and Edmonton, 600 miles still north of the line, a growing city with railroads, and to be a great city very soon. What train loads of people are hurrying into that great, new northwest, and with, by, and around them, are the land agents, speculators, promoters, and "sharks," acting as friends, guides, advisers, and custodians of "trust funds," as thousands of these crazy land seekers will find to their surprise, later on.

But what of the great valley itself, this side the line? This great inland, black soil sea, soon destined to be the habitation of a million of people, and yet 40 years ago a great unsettled prairie, home of Indian and buffalo; here and there a trader's post, and from north to south on the narrow sand ridge, 20 miles east of the Red river, ran the old trail from Fort Garry to St. Paul, over which went the wooden ox carts of the Hudson Bay Co., laden down with furs, and "general merchandise" up—though which is up or down is hard to decide, for the Red river runs north to Hudson Bay, and the Mississippi, paralleling it, runs south?

How it has all changed! A land of farms, villages, cities and electric lights, a land of much railways, telephones and school houses! A land of elevators, often five and six to a little town, and now, under the shadows of these elevators, the creamery is showing up, for on the east bank of the Red river are over fifty creameries and cheese factories; the first making butter so fine that it commands a premium of a cent in New York over the best quotations. Some of these creameries make 80 sixty-pound tubs a week, 5,000 pounds; and that in a locality, where they told me two years ago, "Don't talk dairy up here. This is a grain country; cows won't live in this climate." Well, they do, and Sam Haugdahl showed how to win first premiums, and now up there it is dairy and creamery. They wanted to hear, about good stables, silos, and how to make milk in the winter.

The valley looked better to us than two years ago. Then it was one flood after another, and gumbo tar was legal tender as currency everywhere; prairies were lakes, and almost any where was a river. Conditions were everywhere unfavorable for farm machinery that had been standing out of doors since the preceding fall. Now all was changed. There had been an absence of rain for weeks, and the crops were in sad need of a good soaking shower. The farmers were consoling themselves by asserting that the Red River soil would stand a lot of dry weather, which seemed to be a fact—in truth standing it better than were the crops. The drouth was telling where the good farmers lived. Over east of Crookston, where the Frenchmen who do not believe that manure injures land and put on stable manure, even to their pastures, they had magnificent crops. In some places they were offering up powerful smelling sacrifices to Jupiter Pluvius, by burning tons upon tons of manure—actually firing it—to cause rain, a habit they will outgrow sometime, and put it on the land to conserve moisture.

It is no use to say that the soil, even of the Red River valley, is possessed of a conservation of fertility, sufficient for all time, if grain growing is to be maintained. The great want of the Valley to day is rotation of crops with grasses and clovers live stock, fenced farms, and dairying with its double purpose of adding more live stock, and its steady money crop; not the one pay day in the year, that amounts simply to a transfer to the store keeper and machinery man, of the year's farm product.

Just now these farmers who are going into stock raising, and supplying creameries, are up "in the air" about the kind of stock they want, and they are getting no end of advice to get the combined cow, that is good both for milk and beef; that some beef and some milk, combined, equals the product of the strictly dairy cow. Still another theory, that some high in authority are going to prove the most profitable way, is to have a strictly well-bred dairy cow of some of the dairy breeds, and breed these cows two years to beef breed sires, and the third year to a dairy sire to maintain the dairy side of the proposition, and this third year raise the pure bred dairy heifers and keep up the dairy. Half of the cross bred heifers, they say, will be great milkers, and so the dairy will be maintained, the beef industry promoted, and all will be happy, except one Swede who remarked; "How am I going to sell the beef off from that cow to go with the milk?"

Some of these new creameries are models and up-to-date in every way. Few of them are promoted concerns, but co-operative from the start, and built and furnished at actual commercial cost; no skin game in it. They are nearly all run on the home separator plan, and the sale of separators in the northwest is remarkable. I was in a little away-out-on-the-prairie town, and the storekeeper said he had sold 16 separators this summer, to farmers who did not patronize the creameries. The character of the butter in these creameries, as a rule, was very fine, and if they can maintain the rule of demanding the delivery of sweet cream, there is little likelihood of much trouble. It will come, if at all, by too far apart deliveries of cream, with its consequent lack of uniformity. The now three-times a week delivery, and later on twice, may call for amendment, but certainly it would be hard to find finer butter than we came across up in this north country, made from the milk of these prairie grass fed cows, and creamed at home.

Over at Gentilly we were treated to a great surprise in the way of a cheese factory in that French settlement, the guiding genius of which is the resident parish priest, Father Eli Theilion. Here for several years a cheese factory has been in most successful operation, and is now taking in something like 7,000 lbs. of milk daily, which is made into the finest of full cream cheese, and is not only premium winners wherever shown, but

"SUMMER FOOD"

Has Other Advantages.

Many people have tried the food Grape-Nuts simply with the idea of avoiding the trouble of cooking food in the hot months.

All of these have found something beside the ready cooked food idea, for Grape-Nuts is a scientific food that tones up and restores the sick stomach as well as repairs the waste tissue in brain and nerve centers.

"For two years I had been a sufferer from catarrh of the stomach due to improper food, and to relieve this condition I had tried nearly every prepared food on the market without any success until 6 months ago my wife purchased a box of Grape-Nuts thinking it would be a desirable cereal for the summer months.

We soon made a discovery, we were enchanted with the delightful flavor of the food and to my surprise I began to get well. My breakfast now consists of a little fruit; 4 teaspoonfuls of Grape-Nuts; a cup of Postum, which I prefer to coffee; graham bread or toast and two boiled eggs. I never suffer the least distress after eating this and my stomach is perfect and general health fine. Grape-Nuts is a wonderful preparation. It was only a little time after starting on it that wife and I both felt younger, more vigorous, and in all ways stronger. This has been our experience.

P. S.—The addition of a little salt in place of sugar seems to me to improve the food." Name given by Postum Co., Battle Creek, Mich.

ANOTHER PROP KNOCKED FROM UNDER HIM.

Our "would-be competitor" the De Laval Separator, in his efforts to counteract the fact that the U. S. Separator is the better skimmer, has tried various schemes to prop up his trembling frame and waining popularity.

He used to try the "Churnability" bluff, but this prop was knocked out long ago, then he howled about flushing the bowl with hot water, but the U. S. corrugated cups quieted him on that, and lately it has been the "cold skimming dodge" whenever he has run up against the U. S., but alas this also has been knocked from under him, so that now about all the prop he has to lean on is that of "bluff."

That readers may fully realize how little ground there is for advocating cold skimming, we give below a portion of an article that appeared in the June 18th issue of the Kansas Farmer headed "Abuse of a Hand Separator" by Prof. Edw. H. Webster, formerly of the Kansas Agricultural College and now one of the Government Dairy Inspectors:

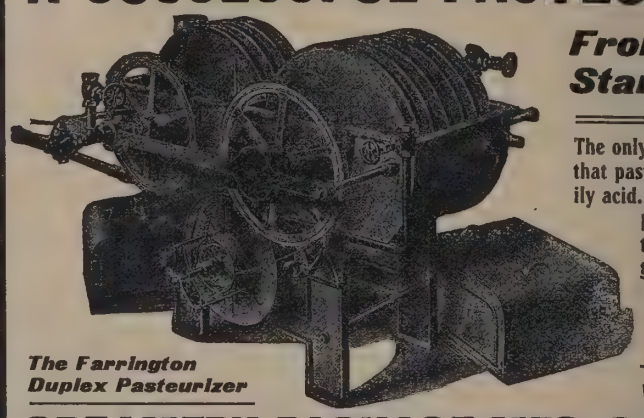
"Other abuses were in time met with in the tendency of agents to follow methods that would be condemned anywhere else. One of the principles of separation understood by all creamerymen, is that the warmer the milk the more complete the separation. Yet agents will run cold milk through just to beat the other fellow. This is wrong for various reasons:

In the first place the milk should be skimmed warm in order to get the best separation of the cream.

It should be skimmed when warm in order to give the calves and pigs the warm skim-milk, and

It should be skimmed fresh from the cow in order that the cream may be quickly cooled to prevent the developement of bacteria.

Everything is against cold skimming and in favor of warm skimming, and the tendency of these contests is to give the farmers erroneous ideas in regard to the hand separator."



What further evidence is necessary to convince you that the De Laval has to depend on other things than its merits to sell its goods? Remember

which the experts score up to the very top. It was a great treat to hear the Rev. Father tell the history of that cheese factory, and its influence in building up the prosperity of the community about there, and how he had labored from first to last to make it a success; how he had been, and now is its president, salesman and clerk, and chief promoter, and at last had seen the full fruits of his exertions for the welfare of his congregation.

"Yes," said the father, in reply to some inquiries of mine, "I have preached other things than theology from the pulpit. There have been many exhortations about eradication of mustard, application of manure, fencing farms, how to do better dairying, better stables and farm topics, as an after topic of the sermon, for I think good farming is one of the means of promoting grace." As we looked over the farms, saw the herds of cows and bunches of steers and even sheep, and noted the fenced farms, splendid grain crops, clean culture, snug farm buildings and good barns, when ten years ago the finances of that locality were not promising, and now are a synonym of prosperity because of the influence of Father Theilion and the dairy boom, it was not a hard thing to do to give this robust country priest much credit for his efforts in both the Lord's spiritual and agricultural vineyard, and wish for more Father Theilions.

It was pleasant to note the great changes two years had brought to the valley. The wild, strenuous land rush was over; the agents mostly gone, and improvements were seen on every hand. How the little villages are growing! New farm houses and red barns greet the eye in all directions. Huge canal ditches are being cut to run the surface water to the Red river, and miles upon miles of smaller farm ditches are being cut to these outlets. It is hard to find any down hill. One ditch was cut to a surveyor's level, for five and a half miles to get a fall of four feet—the depth of the ditch. Roads are being graded everywhere, a regular dyke, high above the prairie, by the use of the great 20-horse graders, with their elevators; the idea being to keep the wheel tracks high and dry above the water level in rainy time. In dry time, gumbo makes an asphalt pavement of great excellence. It's when gumbo is half water, that the question is, to go or not to go.

There is a great future for that valley. The next twenty years, if fraught with the same spirit of progress, will see something akin to an inland empire up here, but it will be thoroughly American. It is wonderful how these people, so lately emigrants, have become imbued with Americanism, politics and all, and with shoulders to the wheel, are bound to do great things for the northwest. They want to know the latest and best, for strangers in a strange land, pioneering in truth, are wonderful apt students. When they have gotten the scheme of dairying in mind, and comprehend its principles, it will be far from a dual, or a general-purpose business that they will conduct, but will be a substantial 20th century enterprise, a credit to the valley and the state, and possibly a particularly good pattern for the eastern dairyman to copy after.

All things considered the summer institutes were a great success. The experiment station, at Crookston, co-operated in every way to contribute to the series. With the new barn, silos, and the like, dairying is to be made a feature of prominence at the station, and will be of great influence. Under the circumstances, dairying was made a special part of the meetings; Messrs. Hoverstadt, Trow, Griswold and Mrs. Robbins making united efforts to promote its adoption, and "yours truly" looked on and applauded.

Crookston, Minn. JOHN GOULD.

Notes from an Iowa Dairy Farm.

ED. HOARD'S DAIRYMAN:—Since visiting Fort Atkinson last April, we have done considerable thinking and a little work. Have thought it might be of interest to some, if we told something of what we have done and are now doing. Here it is: We have a little dairy, milk for city retail trade, make a little butter and cheese; sell all from our own wagons or depot at retail; been in the business three years, July 1.

We started out with wild hay, some millet and straw for rough feed in winter, with bran, corn and oats for grain, blue grass pasture for summer. Last year built one round silo, sixteen feet in diameter, thirty-five feet deep; twenty-four feet of staves, eleven feet in ground, cemented on the clay to top of ground, then stone wall for foundation; built in end of bank barn, running three feet below basement floor. We filled this silo with corn and second crop clover, corn frosted and last very dry. Mixed driest corn with clover cut when wet in morning, one load clover three of corn. Did not put in any water, came out all right, with no waste to speak of.

We built, or made over, an old ice house for another silo, nine feet in ground, ten feet above ground to eaves, making nineteen feet deep, eighteen feet wide and thirty-two feet long; filled with sorghum one-fourth, corn three-fourths, all frosted, cut both dry and wet, but most of corn was greener than sorghum. Used no water. All came out in fine shape, and made good feed.

We have in both silos at this time several tons of ensilage, but pastures in this section so good, do not feed ensilage at present. About one-third of the ensilage in square building, above the stone wall spoiled, below but very little. We do not consider square building the thing for silo and shall not use this one again, but build two round ones instead. I fed to cows, hogs and sheep. All liked the feed and did well.

For this year I have a variety of crops. First of all, I have seven acres of alfalfa, put in with oats, one bushel per acre, alfalfa 25 lbs. seed; on land sown last year to sorghum, disced, harrowed and manured before seeding, then harrowed. Have manured about one-third of piece since seeding; land fairly well drained.

At this time oats are nearly headed; alfalfa about eight to twelve inches high, with roots eight to twelve inches long. Oats would go about thirty bushels per acre if left to ripen. We shall cut as soon as berry begins to form.

We sowed about thirty acres with wheat one-half bushel, oats one-half bushel, barley one-half bushel, Canada peas, one bushel. Grain is now all in head. Peas not good stand only in spots, they being in pod and blossom. This is for hay. It would probably yield if threshed about forty bushels per acre.

Have sorghum drilled with corn planter, one peck per acre; kafir corn same, then have them mixed half and half, with

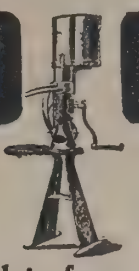
"ADVERTISEMENT."

COFFEE SENT HER

Back to the Country.

A young woman of Bradford, Vt., made her way to a good position in a big Boston store and gave it up because of sickness at home, but it all came out right at last and she tells the story this way: "Two years ago I had to leave a position as book-keeper in a Boston department store to go back home to take charge of the old place as Mother's health seemed shattered, and what do you suppose proved to be the cause that forced me to return?

I found her very weak, unable to sit up all day and with a dizzy feeling if she tried to move about. She had been advised to stop coffee drinking, but as she had used it from childhood it seemed as though nothing could take its place. I had settled down to stay at the farm when one day I got to thinking over the situation and concluded to try an experiment. I got a package of Postum Coffee. It was not cooked right the next morning and we were all disappointed. That was because we had tried to make it like coffee. Next morning I had Postum made according to directions and we were all delighted. In a few days you should have seen the change in Mother. Since that time we have never drank coffee and now we all drink Postum twice a day and sometimes three times and think it superior to coffee.



The change in Mother's health since she quit coffee and took up Postum has been wonderful. She is once more able to take the work again, quite well in fact, with no more weakness and nervousness, no more sour stomach, no more trouble of any kind. To cut a long story short she is now entirely well and I am going back to Boston in a few weeks, thanks to Postum." Name given by Postum Co., Battle Creek, Mich.

Ice cold Postum with a dash of lemon is a delightful "cooler" for warm days.

Empire Empire

Eight Years — Fifteen Cows

The Empire Way Makes Cows Pay.

1895 1896 1897 1898 1899 1900 1901 1902

How's This for a Record?

Emporia, Kans., Jan. 2nd, 1903.

Empire Cream Separator Co., Bloomfield, N. J.

Dear Sirs: Have used one of your **Empire** Cream Separators for the past eight years, during which time I have been milking at all times from twelve to fifteen cows. The cost for repairs in the eight years has been only seventy-five cents. I have had experience with other separators but consider the **Empire** superior to any other, as it never caused me any bother. It is easy to clean and has proven very durable. It does good work at all times. L. H. VAHSHOLTZ, Rural Route No. 4.

The Empire Cream Separator turns more easily, is more easily cleaned, does better work, and costs less for repairs than any other, because it is the **simplest separator made.** Don't buy a separator until you have investigated the merits of the Empire.

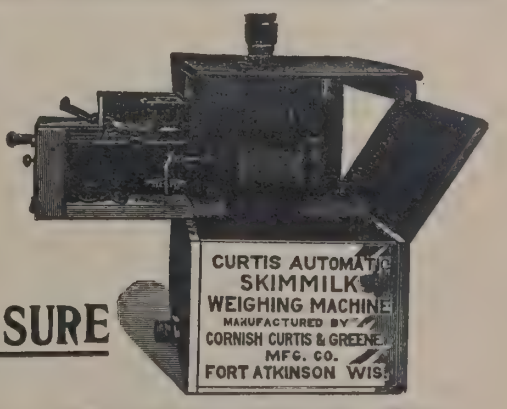
THE MILK SHIPPER

of all people is best fitted to judge of the merits of a milk can. He knows just what extreme hard wear a can is subjected to, not only in the milk car, but in the city delivery wagon as well. He knows what economy there is in toughness and smoothness, which mean wear, resistance and ease of cleaning. Because of this knowledge he

Has Set the Seal of His Approval

on the **Buhl Cans.** This is witnessed by the large number he has bought in the past and by his **repeated and ever increasing orders.** He never makes a mistake, because he has learned that any milk can stamped with the Milk Can Trade Mark is the best milk can for the money. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. All dealers sell them. Ask for the **Buhl.** Look for the Milk Can Trade Mark. No other Can so good.



Buhl Stamping Co.,

half the seed above. Also have the sorghum with dent corn, half and half. Have also soy beans with corn, half and half, and soy beans alone. Also have cow peas, one-half bushel per acre in drills with corn planter.

The land for cow peas was manured before plowing, then harrowed well and planted, then harrowed well again. That for kafir corn the same, all now having been plowed with common corn plow twice and crossed with weeder twice, beans and peas all being in same field was gone over at same time in same way; some were broken off the first time over, when quite tender, but do not think they were damaged to the extent of good done by the weeder in loosening the ground in the row. The ground has been thoroughly packed with the frequent heavy rains so that now it is very hard and needs cultivation to loosen up the top.

Our piece of kafir corn did not show good stand, owing I think to being planted too deep, but still keeps coming;about one-sixth of crop showing.

The land on which all these crops are growing is light and quite sandy, rolling enough for good drainage. It is comparatively new land,much of it never had any manure, and none has ever been seeded to tame grass. Last year sorghum grew on one field and made about eight or nine tons per acre, after having been frosted. Have some clover of last year's seeding, very fine, on same land, also timothy.

Will say we had trouble in not being able to keep our milk clean enough for city bottling and have now adopted the absorbent cotton scheme which is giving good satisfaction.

This I think will be enough for our first introduction, but we may have more to say when we have siloed our peas, beans, sorghum, corn, etc.

Haying in this locality has been delayed by the incessant wet weather. Clover badly down. But for so many other silo crops our clover would have gone in before this. O. GATES.

Estherville, Iowa.

JOHN A. SIMS,
CONCORD, N. C.

No. 20 ENSILAGE CUTTER

These cutters are built especially for Silo use and are strong throughout in their construction, with heavy frame built low to avoid extra staging or tables to feed from. The cylinder shaft is 1¾ in. steel and has 3 babbited boxes, making 13½ inches of bearing surface. The balance wheel is closed, weighing 170 pounds, secured by side headbolts on flanged collar, keyed on the shaft; the heads of these bolts turn ¼, in case of any obstruction reaching the knives, and allow the balance wheel and pulley free speed, while the strain on the knives is relieved at once. The traveling feed table is controlled by the reversible lever and is instantly stopped or reversed. The slats on these tables travel over a close bed, full length and are close together to prevent fine leaves getting into them and winding on the rollers, also guards over the chain links. The length of cut is easily adjusted from ⅜ to ⅝ and ⅞ inches by the gears on the shaft. We furnish chain elevators of any length desired, straight away or side delivery. Weight of Cutters with traveling table, 1600 pounds. Send for circulars.

I. B. ROWELL & CO.,
MENOMINEE FALLS, WIS.

SHEBOYGAN FALLS, Wis., July 15—Sixteen factories offered 1,432 boxes of cheese on the call board today and all sold as follows: 9 Twins at 10¾c; 343 cases Young Americas at 11⅜c; 136 cases Longhorns at 11⅜c; 568 at 11¼c. Market steady and firm.

NEW YORK MARKET.

NEW YORK, July 18.—Butter—Receipts for the week, 67,168 packages. Exports for the week, 530 packages.

Receipts continue heavy and are largely in excess of one year ago. Trade, however, has been good, both for consumptive and speculative accounts, and we note sales of long lines of high scoring extras at 20¾@21c. The bulk of fancy creamery butter arriving sold at 20@20½c, while under grades were hard to move at 17@19c. The N. Y. State Dairy butter is coming poor, and lots that have accumulated are being offered at 16@17c. Some sales of fancy selectious of Delaware tubs at 20c, and really good tubs went at 18@19c. Outside of fine butter for table use, all grades are dull, in full snpply and prices in buyers, favor. We quote!

Creamery, extra, 20½c; medium, 19@20c; poor, 15@18c; Dairy, extra, 19@20c; medium, 17@18c; poor, 14@16c.

Cheese—Receipts for the week, 38,958 boxes. Exports, 2,678 boxes.

There was good, free trading all the week and best cheese were all taken on arrival. We note sales of fancy cheese at 10¼c; and oue parcel was reported as sold at 10⅜c. Skims of all grades are wanted. Sales in the interior of the State were mostly at 10½@10⅜c. We quote:

Full cream, extra, 10¼c; medium, 9½@10c; poor, 8@9c.

Eggs—Receipts for the week, 61,752 cases. Fancy fresh eggs are really scarce and wanted at long prices. Other grades are abundant and freely offered at 13@16c. We quote:

New York & Penn., strictly fresh laid, per dozen, 20@21c; Northern & Western, strictly fresh laid, 18@19c: all Sections, poor to good, 12@16c.

A splendid opportunity is offered for an enjoyable vacation trip. Several fine trains via the North-Western Line daily. Apply to agents Chicago & North-Western R'y. 16-sp

Handling Bad Bulls.

(Continued from page 547)

Pat or the bull?" "Oh, Pat cleaned out the bull good." Next time it was the bull got Pat down and made it pretty hot for him.

One day Mr. Kelly rented his fine ranch to John Yermini, and the son from Switzerland not being of the fighting blood like the son from the Green Isle, or Canada, immediately got worsted. John came in limping, telling Mr. Kelly to take the bull away, as he would not keep the scrub. Mr. Kelly went out, threw a long rope over his horns and was leading the bull by the house. The gentleman's wife from behind a hedge said: "John, Pat ain't afraid of the bull." Mr. Kelly took his eye from the bull a moment to see where his wife's voice came from. It was a fatal moment. The bull made a lunge, caught the unfortunate man on his horn with a large gate post behind him, the horn went right in the abdomen. The dying man said: "Shoot the bull; send for Father Kennedy." It was all over. As we live so we die, whether fighting bulls or otherwise.

The reader can see it was the bull's faulty handling. Of course one man handles a bull safely that another man would get killed by. Yet this inquirer is a man who could, with a little coaching, handle any bull. As our editor says "the best way is to handle young." The experiment stations say: "Take the calf at four months old, put a very small inch ring in the nose. Use a trocar to do it, which makes an easier, quicker, more humane operation. Take ten minutes time each day as you would halter-break a colt. Have a stick with a brad in it when you say whoa, emphasize the word with a small jab. As soon as the command is obeyed quickly, feed a carrot or what you may have."

Right here is where the scientific part comes in, running from the point of conquering into subduing. Everything conquered is not safe while subdued it is. The Irish, Poles and Hungarians have been conquered some time, not subdued yet.

When you get a chance to purchase, or own, a valuable bull that has years or his horns, remove the horns first; have a large ring put in, not the common copper ring, they have a large brass ring as large as the end of a man's little finger.

This ring don't wear and cut them like the copper. Let a piece of rope be always in it long enough to tramp on, this slows the brute to tramp on his own nose, if he is too fresh or wishing to approach you first. Have a ten foot stick, one by two inches, get a bolt ¾ diameter 2 feet long, stick in the fire, or first fasten to your pole this bolt, warm good and red and go out to do business.

If he approaches with bellowing, pawing, just rub the bovine across his nose right and left quick, do not follow him up when he seems to be satisfied. Many spoil the conquering act by chasing into a corner and get a fight they cannot check. The lion and tiger tamer use this method. The writer is a wild horse and bull tamer, not on paper alone, and the one trying those methods will be rewarded. Remember, as soon as you get the conquering part get to work on the subduing part, give your animal what he likes to eat. You may first have him hungry to begin, this prevents sullenness.

Would the gentlemen that wrote about spraying aged cows, some time back, mention how he confined his cows while operating? B. A. F.

Arcata, Cal.

Price for Buttermaking.

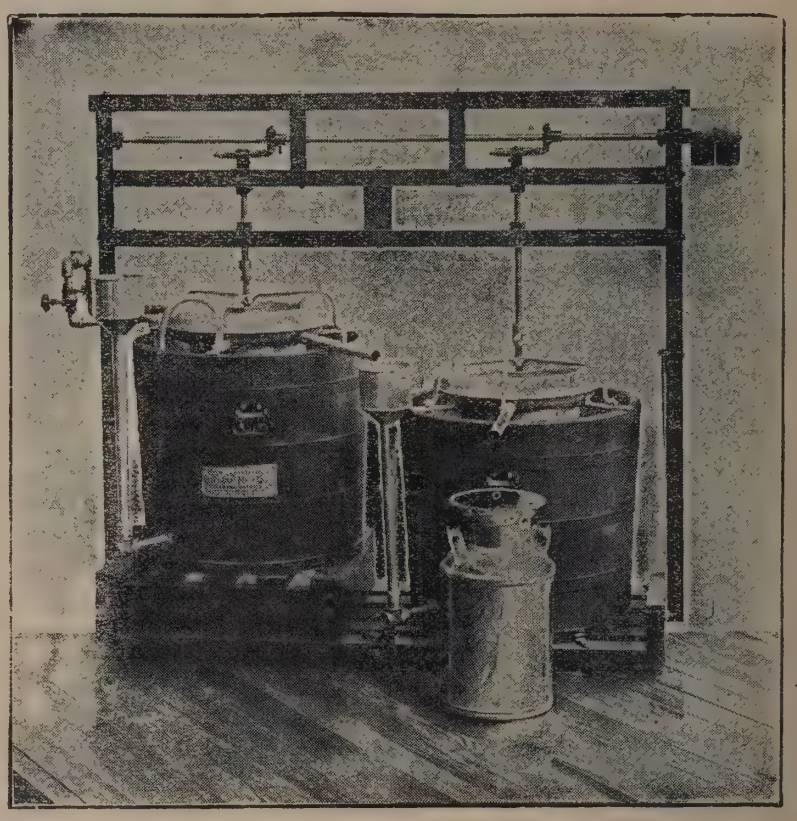
[Paper read by C. J. Dodge at Wisconsin Buttermakers' Convention, Waukesha, Wis.]

At what price per pound can butter be economically made at creameries? There are so many factors to be considered in the question of the cost of making that a good many creamerymen are apt to lose sight of a part of them and laboring under the impression that they have considered them all are surprised at the end of the year, or of a series of years, to find their cash balance on the wrong side of the ledger. Creamerymen are human, the same as the farmers are. They often hate figuring and calculating and planning, but like an active, do-something life, as the farmer hates book keeping, but enjoys the active life he lives.

Now it seems to me that the creameryman has an absolute duty to himself and to his patrons in the matter of the book-keeping part. He must have a complete and accurate account of each day's receipts of milk, the amount of butter made from it, the number and size of packages made each day, the yield each day, the full account of the retail butter, and by full I mean the name of the party sold to, price, and any facts that afterward may be of service in settling a dispute that might otherwise arise. I think it always best to close this report with a record showing the part package left over,—as 12 lbs. solids and 20 prints. My reason for this latter entry is for the purpose of proving up the work the following day. A man as busy as a creameryman is, with 40 or more patrons after him, is liable to forget to make a record now and then. If now he has the closing record of the previous day, he can prove the accuracy of his work, and if he has a shortage, can think back and locate the man that got the butter that is not recorded. I have found this so valuable in my own experience that I have adopted it in all my creameries, having the weekly reports show the daily details.

All this may seem a little out of line with my subject perhaps, but it is not, for first of all the creameryman must know absolutely what his month's butter is going to bring before he can take the first step towards making his dividend. When he has that point established, he must first take out the making, and our question deals directly with this—what shall it be?

Now in all ordinary creameries, there are expenses that are constant, whatever may be the run. Taxes, rent, original cost, and interest on same, to a certain extent fuel, help. In other words, so far as these are concerned 1,000 or 6,000 lbs. daily is nearly the same as to expense. This rule does not apply to supplies of course. Then there is the question of cost of fuel, that is a varying factor in different places; some must burn $6 coal, some $7, some $3 coal; some must pay heavy taxes, some light; some are running a creamery worth $1,000, some worth $5,000, and the $1,000 building may be doing the business, and so it goes.



I have made a careful study of this question with the idea of doing full justice to all and after twelve years of experience I must say that the creameryman who attempts to make up for less than 3½c per lb., where the runs will not average 4,000 lbs. daily the year around, is taking grave chances. It is my opinion that most of the failures in the creamery business are due to haphazard work and not getting out the making, and I tell you, brother creamerymen, that it is not for your protection alone that you do this, but it is for the interest of your patrons as well. The surest way to kill the creamery industry in a community, is to have the creamery fail.

Perhaps some of you will say this does not help us in determining the absolute cost of making a pound of butter. This question puts me in mind of a scene in a play I saw when I was a kid and could laugh easy. A darky was propounding the end man a question—A ship was 200 ft. long, 30 ft. wide, 25 ft. deep; had 3 masts and could steam 15 knots an hour—the darky very impressively emphasized each detail of the problem in his characteristic way—"Den de questium is, sah, to figure dis all up and tell me de captain's name."

Now, it seems to me that the cost of making is about as hard to figure out as the captain's name was for the end man. I think, however, that assuming as a basis $50.00 help, $4.00 coal and $2,500.00 investment, with 10% interest on the same, the making can be safely and justly made on the basis of this: The factory must always pay the expenses of running when running less than 4,000 lbs. per day, the creameryman to get 3½ cents per lb. when running 4,000 lbs. per day, to 2½ cents when running 9,000 lbs., taking off 1 mill for each 500 lbs. increase in milk. With extreme prices of fuel the difference between the actual cost and the $4.00 price should be stood by the dividend. My reason for this is, that it is an extreme price, and creamery men, in making their calculations, could not foresee this heavy tax upon them, and it is not just to ask them to stand it.

There is another element in the cost of making that I have not mentioned. It is in the question of yields. Some factories have an average yearly churn yield as low as 4.20, others run as high as 4.80. It will at once be seen that here is an

A GREAT SUCCESS.

The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

THE MILLER PASTEURIZING MACHINE CO.

element or factor that must enter largely into the cost of making. Then, too, there is the question of the ice and its cost. To some creameries this is a very small item; to others, it is a very heavy one. Then some creameries can pump their water from a shallow well, or perhaps may even have a flowing well. While others may have to pump it one or two hundred feet at an expense as heavy as the running of a separator. Then, again, one creamery is right at the station and at no expense for hauling to speak of. Another creamery at a country point may find this a very heavy and constant tax on the cost of making.

While I have suggested some of the more prominent factors that enter into the cost of making, I have no doubt that others will come to your mind and so I will close that others may add their experiences or ideas along this line.

Gassy Curds.

ED. HOARD'S DARYMAN:—I have been having for the last week nothing but pin holes. Can you tell me what causes it? The milk seems to come in all pretty good in the morning and works good till matted down to a one-half inch thick, then it commences to be just full of pin holes. I worked at it till eleven o'clock at night and by the time it is ready for the press I have them all worked out. I run from three quarters of a inch to one inch of acid in the whey and use a common starter. Now won't low land pasture cause this? I think it will. F. Y.

Weyauwega, Wis.

ANSWERED BY U. S. BAER, MADISON, WIS.

Judging from this maker's brief review as to the manner and time employed in ripening and maturing the milk and cheese curds, I would say that his process of developing the desirable fermentation is too slow, giving the undesirable the ascendency over the lactic acid germs which are the cheesemaker's best friends.

Gassy fermentations are almost sure to produce undesirable taints that pass over into the cheese, materially injuring its quality.

If the difficulty appears before the milk is set, the milk is said to be "gassy." Often it is delayed until the cooking process, when the curds rise to the surface of the whey. Such curds are termed "floaters."

Some curds develop gas in the early stages of matting; this we term "pin holes" in the curd.

In the case at point the appearance of gas is delayed until near the close of the process of manipulation, and we call it the "huffing" of the curd. All of these appearances, whether they occur in the milk, curd, or green cheese, are to be traced back to a faulty condition in the milk.

The application of the Wisconsin Curd Test to the milk supply of the factory will surely point out the detective milks containing the noxious germs that cause the above named abnormal fermentations. All such milk should be refused.

The extent and rapidity of the development of gas in the factory can be controlled in part by the cheesemaker, but it must be remembered that unless the factoryman is furnished with clean, pure milk, free from these taints and gas, he cannot hope to make a first-class article.

I would suggest the liberal use of a good, clean, commercial starter. It should be added to the first milk weighed into the vat and the steam applied so that the vat will be ready to receive the rennet as soon as the last batch of milk is received. By doing this, the lactic acid germs introduced through the starter, get an early start and overcome the undesirable taints and fermentations. I think it was Monrad who said that "starters like charity covers a multitude of sins."

Tainted or gassy milks, should be ripened lower than normal milks; to that point where the whey will be ready to remove in one and one-half hours from the time of adding the rennet. Curds from milk of this character will stand more acid in the whey. If properly formed, one-fourth inch string on the hot iron at time of dipping will aid in keeping the lactic acid in advance of the objectionable fermentation in the subsequent process of matting and piling.

Allowing a little more moisture in the curds up to the time of salting will also aid in the rapid development of the lactic acid.

One-fourth pound more salt per one hundred pounds of curd should be used than is customarily applied to normal curds, to expel the excess moisture, improve the flavor and give keeping qualities to the finished product.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

A Question on Skim Milk Value.

ED. HOARD'S DAIRYMAN:—The following inquiry has been received:

"Do you know of any experiments conducted to show the relative feeding value of skimmed milk, fed while still containing the animal heat, and skimmed milk that has been artificially warmed after having become cold? I don't want you to go to any trouble, but if you can put me on track of a station report describing such experiments, I will greatly appreciate it."

Chicago, Ill. F. B. W.

The correspondent raises a pretty fine point and one upon which no direct experiments have been made, so far as I am aware. If the skim milk be cooled well as it comes from the separator and be kept in a cool place, in a clean container, until it is artificially warmed again, there is no reason to believe that its feeding value would differ from that of skim milk fed while still retaining the animal heat. But that is a hypothetical case, one which would not be met in practice, for it would be too expensive to cool the milk artificially and heat it again. If the milk is allowed to cool gradually and kept at ordinary summer temperature, bacteria, which abound therein, will have just the right conditions for luxurious growth and the result is seen in the rapid souring of such milk. If the tank or cans, in which the skim milk is kept have not been cleaned well, the souring will, of course, take place so much the more rapidly. While partially sour milk has only a slightly lower feeding value than fresh milk, it is a less satisfactory food for all farm animals, except pigs, than milk fed fresh, and this holds true whether the milk is warm or cold when fed. For this reason skim milk is worth more to the feeder when fresh from the separator or soon after having been pasteurized, than at any later time. It it is also most convenient and cheapest to feed the skim milk that way, if it can be done, as it saves the expense of a second heating.

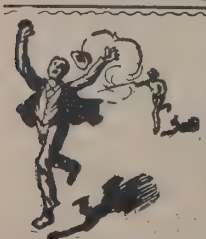
Sunstroke of Horses.

(Newspaper Bulletin.)

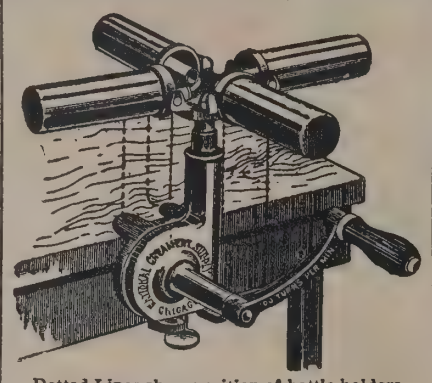


During periods of excessive heat, horses in the fields, or upon the streets, are liable to suffer from sunstroke or "overheating." Much may be done by the owner to lessen the likelihood of an attack. Seeing that affected horses are usually those that are sick or "soft," every possible means should be taken to prevent indigestion and fit the animal to withstand labor in hot weather. Horses under five years of age are more apt to suffer than seasoned. adult animals; hence should be worked lightly during hot weather, as should new purchases and horses being acclimated in a new location. Indigestion, the common forerunner of sunstroke, is indicated by dullness, sluggishness, thick urine, panting at light labor, sweating in stable and the changeable character of the manure, which is normal some days and again clay-colored, mucous-covered, or an undigested, offensive mass. When so affected it is extremely dangerous to work the animal in extra hot weather. Slight change of food, more care in feeding, rest and simple correctives are required in such cases, and preventive measures may be adopted as follows: Feed hay night and morning only; give drinking water before meals and in small sips often when at work; prefer clean, soft water to that rendered "hard" by the presence of lime salts which tend to derange the stomach; remove harness at noon and allow sufficient time for rest and mastication of food; groom skin thoroughly once daily; feed sound food; avoid corn in summer as it is heating; prefer sound, old oats, which repair waste of tissue and promote vim and endurance; avoid sudden changes of food and do not feed heated, green grass or clover; cleanse stable daily, ventilate perfectly, screen doors and windows, remove manure piles from vicinity of stable; feed fresh food each meal. Shade horse's head when at work; avoid heavy, wet sponge; if possible, do not work three horses abreast, as the middle horse suffers thereby and is the most liable to sunstroke; where such combination cannot be avoided, change horses often to afford as much relief as possible. Choose coolest hours for work and change teams often during sultry, moist weather when thunder storms are prevalent.

SYMPTOMS OF OVERHEATING.

Horse lags, requires urging, may pass soft manure and gas, sweats but dries off suddenly, becomes weak, staggers, pants, has dilated nostrils, red eyelids and lining of nostrils, anxious countenance, weak, rapid pulse, high fever, falls. In sudden attack may fall at once, show above symptoms and die in a few minutes or hours after period of madness or unconsciousness and loud snoring. Following bad attacks, brain becomes softened and animal stands with head jammed in corner; is blind, forgets to chew food and remains a "dummy," i. e., stupid, weak and useless in hot weather. Less severe attacks recovered from, unfit horse for work in warm weather.

TREATMENT.



Do not bleed or allow bleeding to be done. Do not give aconite, belladonna, acetanilid—they are highly dangerous in amateur hands. Do not put ice-pack on the head—it tends to produce softening of the brain. Stop work immediately, remove harness, get horse into a shady place, under a tree where there is a breeze or draft of air. Administer half a pint of whisky in equal quantity of water, or two ounces of alcohol (not wood alcohol), well diluted with water, or two ounces of sweet spirits of nitre and one ounce of aromatic spirits of ammonia in

You Coward

You killed him behind his back! That's what YOU would say would'nt you if you saw such a scene as the picture shows? Did you ever stop to think that YOU may have killed someone? You may be sending death and sickness and misery to some happy home because the milk you sell or make into butter or cheese has absorbed diseased germs from your carelessness in not killing that bad odor. Would'nt you feel better to know you had invested $2.50 in a can of Kno Germ that is absolutely guaranteed to kill bad odors, and you had it ready the moment you notice the bad smell? A can of Kno Germ makes 800 gallons liquid odorless Disinfectant-six large barrels-costs you $2.50. Guaranteed by us and your regular supply house. Be ready and order TO-DAY, or send 5-cent stamp for sample can and test it. Sample makes 10 gal. liquid odorless, disinfectant. Splendid in the sick room. May save you doctor's bill, perhaps life. Don't put it off, write us now while you think of it. M. H. FAIRCHILD & BRO., 399 Michigan St eet, CHICAGO.

Net		$ 78.20	Net		$295.00

The Jersey is sometimes condemned as an insufficient milker for milkmen's use. It is not true, however, of such strains as are bred for deep milking qualities as well as richness. Above is the record of one of the deepest milking daughters of "Exile of St. Lambert, 13657," and the herd contains other heavy milkers. If you would improve your herd by a bull calf, buy him now while you can. A little book tells much about the subject. Write for it, and for bull sale list. See also advertisements on pages 514 and 536.

WINTERGREEN HILL FARM, Dept. A., Scottsville, N. Y.

J. F. EGERTON, Footville, Rock Co., Wis.

one quart of water. Repeat in half above doses, hourly, until horse revives. Add four ounces of granulated hyposulphite of soda if he is bloated; tap with trocar and cannula high in right flank if bloating is excessive; and in bloated cases give rectal injections of soapy warm water hourly. High fever may be detected by hand in horse's mouth or use of thermometer in rectum. If it is 108 Fahr., or over, give one ounce saltpeter dissolved in pint water, in addition to stimulants prescribed above and repeat in six hours. From start of treatment keep cool, wet packs to poll of head and sprinkle entire body with cold water from a sprinkling can held a foot above body. A piece of ice may be placed in water thus used. If pressure water is at hand, tie hose to browband of bridle and allow gentle stream of cold water to flow constantly over patient's head. On recovery feed lightly upon bran mashes and a little grain, and allow rest for two weeks; do not work again in hot weather during season of attack. Where symptoms of brain-softening remain after attack, give one drachm iodide of potash three or four times daily in a little water, according to severity of symptoms, and continue cold, wet packs to head. Feed soft, light, easily digested food.

A. S. ALEXANDER, Veterinarian.

Wisconsin Agricultural Experiment Station, Madison, Wis.

A Correction.

ED. HOARD'S DAIRYMAN:—Through some mistake the figures $42.70 were given as one-third the value of the milk the cow gives. Instead of that it was the whole value. (Page 507 in DAIRYMAN of July 10th.) Also the word always was added. I wrote "Uses a registered bull but not always a registered bull." G. L. POOLE.

Ohio.

Ropy Milk.

Milk after setting 10 to 24 hours the cream becomes ropy. S. A. G.

Huntington, W. Va.

The above is a case of ropy milk, produced by a species of bacteria. To rid the dairy of it, a thorough cleaning is necessary. Everything connected with the handling of the milk should be scalded with boiling water containing washing soda. This may have to be done more than once, as the ropy milk bacteria is very resistent to heat. It may be also necessary to give the cow stables a cleaning and whitewashing.

A Creamery Patron's Record.

ED. HOARD'S DAIRYMAN:—You wish facts so I will send you the statement of patron No. 1 of the Oakwood Creamery, showing what seven cows returned one man who owned a farm of about one-hundred and thirty acres. His cows, as you see by his tests, are grade cows, yet their returns figure up surprisingly. As No. 1 has no silo he feeds for a grain ration, oats and corn, about two-thirds oats, and feeds liberally, aiming to feed about one lb. of grain to the hundred weight of cow, using corn stover and hay for roughage.

He thinks skim milk is worth to him fifteen cents per hundred lbs. for growing young animals, and a portion of his returns are obtained that way, for the creamery returns four-fifths of the milk taken to it. This man took to the creamery 41,886 lbs. of milk; his returns, according to what he considered his skim milk worth to him, was $40.25, quite an item. I think, from the growing animals I saw at his farm, he estimated his skim milk lower then it was worth to him, but I aim to give the facts just as they are given to me.

This man has always been a careful, pains-taking farmer, making it a point to grow the best crops possible; had never kept cows before, except for family use.

I wish to mention a home-made device I saw at his place to keep his milk cans when filled with milk from being molested. It was a small frame inclosed with poultry netting with a door hung on hinges. This was placed out in the yard away from the barn and from all ordors. The simple arrangement prevented all dogs, cats, and the like from approaching the cans while in use.

I give you his returns for the year: for butter $478.06; skim milk $40.25; calves sold $15.00; milk used in house, $25.00; making his returns per cow $79.75, or in other words more visible money returns than the other sales from the farm. He has no silo and never before made any special effort to know what a cow was worth to him, and does not know what a pound of butter cost him; never has tried to gain any special dairy knowledge but finds he must keep better posted in that line, therefore, subscribed for HOARD'S DAIRYMAN. A. D. B.

Aurelius, N. Y.

Continued Discussion.

"The teacher easily becomes imprisoned in yesterday's methods. He is too prone to look back for details instead of looking about him for present inspiration."—H. D., page 390.

ED. HOARD'S DAIRYMAN:—The controversy about the necessity of feeding concentrated purchased feed to dairy stock has been brought on by the unjust and unkind treatment of my questions by the editor or sub-editor of the DAIRYMAN. No question is settled until it is settled right and in accordance with the best evidence obtainable.

The editor makes two positive assertions:

1. A cow of pronounced dairy temperament cannot eat and digest enough roughage to furnish sufficient raw material from which to elaborate milk up to her capacity.

2. We think that cows will do fairly well on clover silage and clover hay alone, but better and with more profit if they have some grain in connection.—H. D., page 258.

I asked the editor politely to state on what facts and proofs he based these assertions, and requested him to give them to the readers of the paper in detail. Up to date no positive facts or proofs have been presented.

Every man makes mistakes, and if the editor has made assertions which he can not fully establish by facts and proofs, let him say so and the controversy is ended. A straight answer to a straight question is always the best policy.

It is evident that the editor is prejudiced in favor of feeding concentrated foods to milk cows. Let him prove to the readers of the DAIRYMAN that such feeding is for the benefit of the cows and that it gives the largest net income to the dairyman, and every reader will support his theory and advocate it.

Hedging behind such terms: "That farm grown grain crops are fully as concentrated as the general run of the so-called by-products, therefore, the facts apply as much to rations which can be raised on the farm, as to rations made up in part from purchased products," does not better the matter and proves nothing, as it is immaterial to the question at issue.

The question which has to be determined by facts and proofs is: Is it necessary for successful dairying to feed to the milk cows concentrated, purchased food, and can, by such feeding, the net income from the dairy be increased?

If the DAIRYMAN can furnish facts which prove that it is more profitable to the farmer to incur this extra expense, than to rely solely on produce raised on his farm, for the food for his stock, let him produce such facts. I contend that he cannot do this as I do not believe that such facts exist.

The DAIRYMAN has adopted the practice of most of our farmers, to do as their predecessors and ancestors did, and not to go to the trouble of ascertaining the truth.

In support of my position I inclose 8 rations. The first two are copied from page 466 of HOARD'S DAIRYMAN and the rations cost 15½ cents and contain respectively 11 and 8 lbs. concentrated food. Below I give 6 rations which the farmer can raise at a cost of 3½ to 6 cents per ration. Every one of the farmer rations is a balanced ration according to Prof. Haecker's teachings and contains more digestible nutrients than either of the rations costing 15½ cents. None of them is too bulky. The dry matter averages about 24 lbs. and the digestible nutrients about 14 lbs., while the protein in the rations is between 1.69 and 2.04 and can be increased by small additions of soy beans to any desired extent.

A FEW RATIONS FOR COMPARISON.

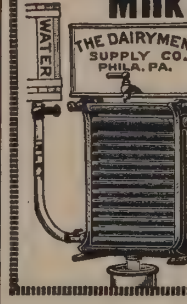
Why will you insist that the farmer shall pay 15½ cents per ration when he can raise on his farm a ration costing him only 5 cents, unless you can prove by facts and figures that it is necessary for the health of the cow to feed purchased concentrated food and that by feeding your purchased concentrated food you increase the product of the cow to such an extent that the income will be large enough to cover the extra expense and give compensation for extra work,

YOU DO THE TESTING
on your own farm and make sure you have a bargain and a money maker, when you buy the
AMERICAN CREAM SEPARATOR.
A friend to every man who owns a cow. A machine that is sold on its merits at a surprisingly low price. Get in touch with us. Write for our catalogue. It Is Free.
American Separator Company,
Won Medal at Paris in 1900. Box 1023 Bainbridge, N. Y.



THE Iowa Dairy Separator.
AN UP-TO-DATE MACHINE REPLETE WITH PRACTICAL IDEAS.
It is built in the following sizes:
250, 350, 450, 600, 750 POUNDS PER HOUR
Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.
SEND FOR CATALOGUE NO. 60 AND PRINTED MATTER.
IOWA DAIRY SEPARATOR COMPANY, WATERLOO, IOWA.

Notice to Dairymen
If you are thinking of buying a Cream Separator write us for Catalogue and information. We manufacture the best machine on the market.
Davis Cream Separator Co.,

MELONEY'S Automatic Milk Cooler and Aerator
TRADE MARK BESTOV

Made of the best conducting material—sheet copper and coated with tin outside where the milk comes in contact. Cools milk quickly. Expels all animal odors and the smell of grass and garlic. Aerates it thoroughly. Can be easily cleaned. Fully guaranteed. Used by the most progressive dairymen. Send for catalogue "Bestov" dairymen's supplies.
Dairymen's Supply Co., Dept. Philadelphia, Pa.

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right.
Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.
J. S. L. WHARTON, Mfr.,
17th Clearfield Sts. Philadelphia, Pa.

DON'T SEND A CENT Try a "1900" Washer for 30 days, free of all charges, freight prepaid both ways. The "1900" Ball Bearing Washer is the simplest, easiest machine ever made for washing clothes. Saves time, money and worry. Write at once to "1900" Washer Co., 219 A State St., Binghamton, N. Y.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.
First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.
The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.
The Reid is perfectly planned and strongly built, and it literally "runs like a watch."
As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**
There is a new (free) booklet about the Reid Hand Separator.
Sizes run from 150 lbs. to 500 lbs. per hour.
A. H. REID
CREAMERY AND DAIRY SUPPLY CO.,
PHILADELPHIA, PA.

BUSINESS MANAGER wanted for company now organizing to manufacture Patented article for dairymen's use. Must invest $2,000 to $5,000. Fine opportunity. CAN REFRIGERATOR CO., 425 W. 4th St., Erie, Pa.

and increase above such extras the net income of the DAIRYMAN?

On your own motion you have publicly made your assertions. It is your duty to prove them or recall them. As editor and teacher of Dairy Science, I think you should collect, preserve and publish all the facts which justified you in your opinion to make the assertions. The subject is of sufficient importance to the whole dairy world to have it cleared up by thorough experiments, ascertaining the real facts and the truth. If by learning the truth the food cost for milk cows can be reduced to one-third, it may be possible to make dairying pay and even to raise beef at a profit.

Mauston, Wis. CHAS. H. GROTE.

Dairy Premiums at the Sioux City Interstate Fair, August 31, to September 5, 1903.

We wish to call the buttermakers' attention to the Interstate Live Stock Fair to be held in Sioux City, Iowa, August 31st. to September 5th (inclusive.) We would like to have a large attendance of buttermakers and dairymen and invite them to make their headquarters at the dairy hall, where nearly all of the leading supply houses and manufacturing companies will be represented. We also urge every buttermaker to compete for the premiums that are offered for dairy products. The premiums offered are as follows:

Creamery butter, $460.00 pro rata for butter scoring above 92. Besides the money premium, first prize will be awarded gold medal, second prize silver medal.

Dairy class, $50 pro rata for butter scoring above 90. First prize, gold medal, providing the score is 93 or above, second prize silver medal, providing the score is 92 or above.

Package butter, pro rata $35 for butter scoring above 91, and $5 additional for butter scoring highest. In this class, dairy butter as well as creamery butter can be entered, but it must be put up in a more convenient package for retail purposes. Earthen crocks are barred from all classes.

For the best four exhibits of cheese, each exhibit to consist of not less than five cheese, $25, $15, $10 and $5. respectively.

Professor McKay from the Iowa State College will act as judge. A stenographer will accompany the Professor and will take down notes about the defects of the exhibits and a letter, together with a score card, will be mailed to each exhibitor. The award of the judge, will be made on the following scale: Flavor 45, body 25, color 15, salt 10 and package 5.

No entry fee required, but each exhibitor must purchase an exhibitor's ticket which costs $2. When writing for exhibitor's ticket and entry blanks address, "Secretary Interstate Live Stock Fair, Sioux City, Ia. Write for entry blanks early.

It is our intention to have the exhibit as nearly uniform as possible, therefore we have put the standard package for the creamery class at 20 pounds and for the dairy class at 10 pounds. We advise the buttermakers to use a standard 20 pound ash tub, using three tins for fastening the cover. On the top of the cover, fasten a tag with your name and address marked plainly on it, then wrap your tub in several thicknesses of paper and ship it in a a 60 lb. tub. When your package is ready for shipment, address it to the Supt. of Dairy Dept., Fair Grounds, Sioux City, Ia. The butter should be shipped so as to arrive at Sioux City no later than Monday morning. No butter will be accepted later than Monday evening. The Herrick Refrigerator Co. of Waterloo, Ia., will furnish us with one of their elegant refrigerators, so buttermakers can rest assured that their butter is placed in a good refrigerator and it will even be to their advantage to ship it a few days before the fair opens, to have the buiter well chilled before it is scored.

We trust that every exhibitor will furnish an attractive appearing package. An ash tub will be made very attractive by scraping it with glass and then rubbing it with sand paper. We should always remember that the first impression the judge receives from a package, will have its effect on the final score. Use paper liners for your tubs and soak them in very strong brine before using them. Cut the butter even with the tub, a string is very desirable for the purpose. Do not leave any holes on the surface. Fold the side liner neatly over the butter and do not allow it to lap over more than about half an inch from the sides of the tub. When the side liner has been folded, a cloth circle is put on top and a sprinkle of dry salt is rubbed over the cloth. Be sure that there are no black specks in your salt and that there is no dust on the cover, when placing it on the tub. Write to the secretary for catalogue and entry blank

M. MORTENSEN,
Supt. of Dairy Dept.

To Purify Water in an Unused Well.

Will you or some of your readers please inform me through the colums of the DAIRYMAN how to purify the water of a well that has long been unused. It has been pumped dry, cleaned, and some lime put in but that is not sufficient.

Chaseville, N. Y. (MRS.) F. A. C.

The chances are, we think, that the water is contaminated before reaching the well. The sources of this contamination may be a considerable distance away, possibly several hundred feet; or it may be in the wall or behind it. In either event, there is no way known to us by which it can be purified.

This inquiry might well form the text for a long sermon on the danger lurking in wells. A well is a very convenient drainage outlet for the surrounding soil, and if there are any impurities in the soil, or privy vaults or cess-pools within reaching distance, they will be very sure in time to find outlets through the soil into a well. For a time, the fresh soil surrounding a well serves a very good purpose as a filter, but sooner or later, the soil gets saturated with filth, and instead of being a protection to the water it becomes itself a source of contamination. Creameries and cheese factories are frequently troubled by having their wells contaminated in this way.

What to do in cases of this kind is sometimes a very serious problem. Digging a new well, and stoning and bricking it up according to old customs, affords but temporary relief. A well cased up with sewer pipe or iron piping will prevent contamination much longer than a stone wall with open joints in the wall or one cased up with porous brick.

We earnestly advise this inquirer not to make us of the water in this well, however free it may appear to be from offensive taste or odors, until it shall have been thoroughly examined by some competent chemist in order to determine whether there is anything wrong with the water.

When the life of Mrs. Ruff was hanging in the balance she used Dr. Pierce's Favorite Prescription and was restored to health. Her experience made her the firm friend of the medicine that cured her.

Dr. Pierce's Favorite Prescription has no equal in its cures of womanly disease. It establishes regularity, dries the drains that weaken women, heals inflammation and ulceration and cures female weakness.

"Five years ago when my life was hanging in the balance, Dr. Pierce's Favorite Prescription was brought to my home," writes Mrs. Caroline Ruff, Director of German Orphan's Home, residing at 339 Rowena Street, Detroit, Mich. "I took it, and, it won me back to health. Ever since that time, I have been its firm friend. We frequently have mothers come to our 'Home' who are suffering with uterine troubles, inflammation, tumors and ulcerations. Our great remedy for a female trouble is Dr. Pierce's Favorite Prescription, and we have found nothing so far which would so quickly cure the disease, relieve inflammation and stop pains. It is a good friend to women."

Dr. Pierce's Common Sense Medical Adviser, in paper covers, is sent *free* on receipt of 21 one-cent stamps to pay expense of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

Special Offer of Fine Dairy Farm

ADJOINING RED WING, MINNESOTA.

174 ACRES—140 under high cultivation, balance good pasture and woodland. Has complete machinery for Dairy, with power, etc., and all machinery for cutting corn. Two large silos, sufficient to hold feed for 50 cows, and large barn to tie up 70 head. One new house—could not be built for less than $2,500; another good house for help. Large horse barn and granary. Improvements could not be duplicated for less than $7,500. Monthly receipts over $600. All for sale at $12,000.

H. A. CAMPBELL, 107 E. 4th St., St. Paul, Minn.

GOOD REASONS

why land buyers are attracted to **Marathon County** are: Because of the richness of the soil; abundance of water at little depth; fine grazing making it a very desirable location for cattle raising; excellent railroad facilities and competitive markets for dairy, farm and timber products. Central and Northern Wisconsin will be

THE COMING DAIRY SECTION

and has already made great strides in that direction, many fine herds have been established. If you want to **Own Your Own Home** now is the time to buy. Our lands are located in the northwestern part of Marathon County in a country well populated, near the prosperous village of Athens. For prices and further particulars address:

RIETBROCK LAND & LUMBER CO., ATHENS, WIS.

DAIRY AND STOCK FARM FOR SALE

667 ACRES, WAUSHARA CO., WIS.

Three miles from Wild Rose, C. & N. W. R. R. New barn, 34x136, cement floor; new silo 16x27; one barn, 30x40; 3 good houses; hog house; granary; tool house; good water; trout stream running through; "fine fishing;" adjoining two lakes; all fenced; level land. This place could be made into four good farms.

One new 10 horse Gasoline Engine; one new Ensilage Cutter, 10 ton per hour; one new Carrier; one De Laval Separator, new; one new Binder; one new Corn Cutter and Binder; one Seeder; one New Reaper and all other Farm Machinery.

Stocked with Guernseys. This place will be sold with or without stock and machinery, and will be sold at a bargain if taken soon. Address owner.

C. N. GARDNER, Saxeville P. O., Waushara Co., Wis.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn, (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

WISCONSIN

Farm Lands

$8 to $12 PER ACRE.

On terms to suit purchaser. We would like to show you the lands and can give you low railroad rates to come and look at them. This is the future dairying country of the Northwest.

Our lands are only 240 miles from Milwaukee with splendid markets on all sides. None of the land lies more than three and a half miles from the railway station. Write and find out about it. Yours very truly,

INTERIOR LAND CO.,
Janesville, Wis.

We sell on easy terms our own lands in Wisconsin and Canada. **DUNN COUNTY LAND CO.,** Downing, Dunn County, Wisconsin, or 156 East 3d, Street, Rooms 5 and 6, St. Paul, Minnesota.

Dots From a Dixie Dairy.

Working Wet Soil—Corn Planting.

ED. HOARD'S DAIRYMAN:—There has been a cloud over the skies of this section of the "Sunny South," much of the time since last winter, and there has been water in the cloud, and much of it has fallen on this red clay soil. It is too wet to stir the soil a large part of the time, all farm work is delayed beyond the usual time, and planting being late, cultivating is late and as the rains still continue, the grass and the weeds grow on. In striking contrast to the unprecedented dry weather of last year, is this unsually wet season this year; but it seems to prove the truth of the saying "that one extreme follows another."

Continued wet weather is apt to tempt farmers to work the soil when it is too wet, and the result is, that this brick clay soil packs and turns up in clods, that repeated rolling and harrowing fail to pulverize; while if it is plowed when it is just right, it works up very nicely.

We began planting corn April 11, and haven't quite finished yet, nearly the middle of July. That is the advantage of so long a season, as it is claimed that corn will make fair silage, planted the first of August.

We have some very good corn in all stages of growth, up to nearly roasting ears. Our method has been to turn the land with a two-horse plow, harrow with cutaway harrow, rolling if necessary, and following with smoothing harrow, and planting with machine. Where stable manure was used, it was broadcasted before plowing, and two-hundred pounds acid phosphate and potash used per acre. Where there was no stable manure used, we drilled three-hundred lbs. of a complete fertilizer; other things being equal that fertilized with the stable manure seems to be leading. I don't say it to brag, but it is undoubtedly true that our corn is much better than a large portion of that around us, that is planted on as good soil, and in some cases at least is fertilized as well. There is of course reason for the difference, and I believe it is altogether due to a better system of tillage. Much of the corn, and the cotton too, for that matter, has been planted without the ground being turned at all, a furrow is run off with a scooter, or one-horse shovel plow, this is "bedded" by throwing a furrow into that from either side, and the corn planted in this "bed." The middles are broken out at any convenient time, and it seems that it often happens to be convenient to leave these until the corn is 10 or 12 inches high. Then when it is plowed, it is plowed with a "bull tongue" scooter, that cuts 4 or 5 inches deep close to the corn; the subsequent workings are with a cotton sweep, that doesn't cut too deep and seems to be a pretty good tool—if we didn't have a much better one in the Planet Jr. cultivator.

The corn is usually planted in rows 4 feet apart, and thinned out to one stalk every three feet. Of course, we can't expect a very large yield on a field planted in this way. It seems to me that the lack of proper plowing and harrowing the ground before planting, does not give the crop the opportunity to get at the plant food in the soil, that it should have. Again, the root pruning, which is practically what the first plowing is, cannot help it much. Again, in thinning out to such an extent, the corn never can shade the ground, consequently it is much more susceptible to a drouth, it seems to me, than if planted or allowed to stand a little thicker.

I am more than ever convinced that as good crops can be raised here as in the north, if modern tools and modern methods are applied, with a liberal coating of stable manure. There is no longer any question that successful farming cannot be done without stock raising as an adjunct, and there is certainly no form of stock-raising that will pay as well here as dairying. Cotton will always be King in the south, but when the farmers adopt the old cow as Queen, they will come pretty near having a "full house."

It is quite generally supposed that clover does not do very well in the south, but it certainly does in this section. I have seen two good fields of red clover in this county this season. One, as promising a field of clover as I ever saw anywhere, was on the farm of Dr. John Keller, who is said to be the best farmer in DeKalb Co., besides being a first-class veterinarian. We have about ten acres which is pretty fair, though it was late sown and the freeze in February hurt it some. However, we are cutting it the second time and shall get another good crop. We have been feeding it green to the cows, together with oat hay, with most excellent results. I believe the greatest trouble in raising clover here is a lack of thorough preparation of the ground. The possibilities of the soil of this section are hardly dreamed of. When we learn to depend less upon Providence and the weather man, and more upon the plow and harrow and cultivator, and, as I have said before, stable manure, then the harvests will be greater, and prosperous farmers more plenty.

M. E. B.

DeKalb Co., Ga.

The Railroads run on

ELGIN TIME

The Elgin Watch is the watch for those who use railroads as well as for those who run them.

Every Elgin Watch is fully guaranteed. All jewelers have Elgin Watches. "Timemakers and Timekeepers," an illustrated history of the watch, sent free upon request to

"The Salt that's ALL Salt."

and you'll raise its standard to the highest prices. Write for book—"Just Salt"—it's free.

DIAMOND CRYSTAL SALT COMPANY, St. Clair, Mich.

CONCERNING OUR ADVERTISERS.

A GOOD STOCK BOOK.

One of the good books sent out free of charge by our advertisers is that of the Prussian Stock Food and Remedy Company of St. Paul, Minn. We cannot see why it should not appeal most strongly to every live stock owner, whether he keeps horses, cattle, sheep, hogs or poultry. Primarily its purpose is to bring to the attention of stock owners the valuable line of remedies which the company manufactures, as Stock Foods, Poultry Food, Heave Powders, Lice Powders, etc. The book is all the more valuable on that account, for all these preparations have proven their worth and have an established place with up-to-date owners. Leading breeders all over the country use and recommend Prussian Stock Food and Remedies. Mr. E. J. Hurst, breeder of Pure Bred Poland China Hogs, Hacy, Ind., owner of the $3000 Boar "Majestic Perfection" writes as to the Prussian Stock Food: "I have been using it since I started in the business of breeding hogs and I am highly pleased with it. I have been feeding it regularly and have never lost a hog by any disease. I think the Prussian Stock Food will do all that is claimed for it to do." The book is more than an advertisement of remedies. Much valuable information is gathered together in concise form and many hints are to be had as to the cause of past failures and valuable suggestions for the care and treatment of animals that may be well put into practice in the future. We believe our readers are failing to lay hold of a valuable privilege if they do not avail themselves of the offer in the advertisement and write and have the book forwarded to them. All that is necessary is to write how many head of stock you have.

Metal wheels for the low wagons are always to be considered a great convenience and the means of saving the strength of manual labor and the team. It always pays to save the team as well as the workmen. The grooved tire metal wheels are an improvement offered along with the other kind by the inventors and manufacturers, the Havana Metal Wheel Co., Havana, Ill., who are the largest manufacturers of steel farm wagon wheels in America. They guarantee all their wheels, and if one will write them for directions for measurement of his skein they can fit the skeins and furnish any sort of metal wheels needed.

Milk Bottle Caps are made by the Bavier Novelty Co., of Windsor, Conn., and they are advertising in this issue. They think they can interest any user of these caps, and only ask the opportunity to mail a catalogue. Write them.

Feeding Grain to Cows When at Pasture.

ED. HOARD'S DAIRYMAN:—I have noticed your reply to C. A. J., in DAIRYMAN for July 3, in relation to feeding grain to cows while at pasture, and think you are correct. Evidently there is very little time in summer when it will *not* pay to feed a certain amount of grain to good cows, on the average farm.

The past spring was very dry here, and in consequence the grass was fed very closely, even that which the cows would ordinarily reject. This dry spell, unusual at this time of year, lasted until about the 10th of June, before we commenced to have rain. We kept up the feed of grain on turning to pasture, and until after the rain commenced and the grass had gotten a good start, when it was gradually reduced and finally discontinued. The cows during this time did very well indeed, better than could have been expected under such conditions.

But strange to say it was not long after

SOUTH DAKOTA

THE thrifty housewives of South Dakota last year sold poultry and eggs to the value of more than $5,500,000, in addition to having their own tables well supplied with chicken and eggs. The total production of new wealth in the state for the year was about $120,000,000. There are splendid opportunities for success there to-day. A booklet that tells all about South Dakota sent for two cents' postage.

Indispensable for prize winning show cattle. Will groom 30 to 50 head an hour, and do it better than by hand. Get our Free Booklet and learn to groom your cattle, horses and all stock the best way.

CHICAGO FLEXIBLE SHAFT CO., 194 Ontario St., Chicago, Ill.

"COME in the evening or come in the morning, when you're looked for or come without warning"—

You'll always find your Tread Power ready for business. OF WHAT OTHER FARM MOTOR—Wind Steam or Gasoline—can this be said? A PERFECT GOVERNOR ensures absolutely even speed. Send for free catalogue.

St. Albans Foundry & Implement Co., St. Albans, Vt.

Our New Patent

and Great sales are the talk of all who know of them. A fortune has been made by the patentee and the farmer in a short time. For seven months the sales were over $350.00 per day. Something good can't be gotten for nothing. By putting $500.00 and upwards into this business it will be the best paying investment we know of. Farmers using the machine say that they would not do without it for two, three, and ten times the price. Common farmer can handle it in a very paying way. We can prove the great selling qualities of this machine by bank account, the bankers themselves, and the farmer. Our plan is fair and honest. Best bank references. Car fare one way will be paid to responsible men whether they invest or not. Address

CLARENCE RAGSDALE, Moberly, Mo.

Proprietor of Magic City Stock Farm.

the feeding of grain had been stopped before a shrinkage in milk was noted, and it has been sufficient to indicate quite conclusively that it has been enough to have paid for the usual amount of grain fed. In this case it certainly would have been better to have kept right along with the grain, as we have sometimes before practiced.

Some farmers that did not feed grain at all after turning to pasture say there was an increase in yield of milk after the rains commenced, but at first it must have been small.

I thought, certainly, that after a fresh growth of grass had started up it would be of superior quality, but this did not seem to be borne out by the facts. It is a difficult matter at all times to most perfectly adapt the feeding to the best requirements of the cow, as evidenced by the results, but the farmer should endeavor to do this to the best of his ability, and usually he will find his reward in so doing.

We were in hopes that the prices for butter had reached the lowest point several weeks since, but after advancing some two cents a pound, they have again receded to previous quotations, indicating a considerably larger make, but not yet low enough for export. It would seem that the surplus above current needs should now be placed in cold storage, thus relieving any undue pressure on the markets. The quality for this purpose could certainly be no better during the season. E. R. TOWLE.

Franklin Co., Vt.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Ringworm.

I have a calf which has a skin disease which resembles ringworm. Head and neck sore with skin much wrinkled. J. H. W.
Palmyra, N. Y.

ANSWER.

Wash the parts clean with soap and water and apply a solution of chloronaptholeum or zenoleum, according to directions on package.

Catarrh.

About three weeks ago one of our cows began to breathe hard and in a week or so there was a discharge from the nose, which lasted over a week. She still breathes hard, and her breath smells very bad. L. J. E.
Willmar, Minn.

ANSWER.

The labored breathing, discharge from the nose, and foeted breath, are indications of catarrh.

Steaming with medicated water, once daily, will help your case, also give tincture chloride of iron ½ to 1 oz., twice daily. If the animal coughs, you may apply an ammoniacal liniment to the throat, and over the frontal and nasal bones.

Lump Jaw.

I have a cow that has a swelling under the lower jaw, right between the forks and extending back under throat. It is very hard. Cow froths at mouth when chewing cud, and is losing flesh and failing on milk. T. W. H.
Wyalusing, Wis.

ANSWER.

The cattle have lump jaw, which may be removed surgically if the lump is not attached firmly to the bone. It is advisable to attend to this at once if you wish to avoid an infection of the balance of your herd.

Skin Disease.

I have a calf which very often licks its tongue out and around sides of mouth as though it itched.
Atlanta, Ga. J. A. S.

ANSWER.

See ringworm, this issue, and apply same treatment.

Bloody milk.

One patron's cow had been milking about 3 months and was apparently all right; when noticed one quarter commenced giving bloody milk and to get hard, and in a short time the other part of udder became affected and quit giving milk altogether. We also hear of other cows being affected, in the same way. Was it a case of garget?
Marion, Wis. M. B.

ANSWER.

When a cow gives bloody milk, there is usually a rupture of a blood vessel, which may have been caused by external violence, either by a calf, or otherwise. Your remedy is to remove the cause.

A Hard Milking Cow.

Is there any means of making a naturally hard milking cow milk easy? J. K. B.
Elk Mound, Wis.

ANSWER.

Your remedy is the teat bistoury by which you can make the opening in the teat as large as you please, without injurious results.

Breeding a Yearling.

Is there any way to get yearling heifers in calf from a heavy bull? C. H. G.
Mauston, Wis.

ANSWER.

If the heifer will come in heat, there is no reason why she should not breed. But if you wish to use a heavy bull, you may have trouble in delivering the large calf. In this case, it is best to give her a chance to develop more fully.

Salty and Stringy Milk

I have a cow that came in ten days ago, her milk is stringy and salty flavor. J. F. J.
Warren, Pa.

ANSWER.

Derangement of the digestive organs by feeding moldy or fermented food is usually the cause. Remove the cause and thoroughly clean and disinfect the stable and mangers. An ounce of hyposulphite of soda and a dram of ginger may be given in food three times, daily, until relieved.

Horse Owners! Use GOMBAULT'S

Caustic Balsam

A Safe, Speedy, and Positive Cure

The safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes all Bunches or Blemishes from Horses and Cattle. CURE "THE" COW
NO CURE, NO PAY

WRITE, giving symptoms of animal sick, and will ship you by express quantity sufficient to cure your cow with full directions for use. If I do not cure the animal the advice and Cure "the" Cow costs you nothing except the express charges. If I do cure it you can send Postal order for cost of the remedy—$2.00 per quart, $3.50 per half gallon, $6.00 per gallon and pay for what you use. Generally half a gallon cures the worst cases. Give Postoffice and Express office with your order. Address

DR. EATON J. CROSS,
152 Congress St., Troy, N. Y

"Just as good?" "Just as good!" Did you say? "Just as good as Veterinary Pixine!!" The dealer who tells you that is mistaken. He does not know.
FACTS AND TESTS PROVE IT!
Emery, Ky., April 9, 1903.
I feel it my duty to tell what Veterinary Pixine did for a horse of mine. He was cut with a knife between the fore legs three inches deep and two inches long, which every minute would gap open. I used several different kinds of remedy without success, even to having some stitches taken. Nothing did any good and it kept swelling and became feverish. I almost gave up hopes of getting him well. In the columns of the Ohio Farmer I observed your advertisement and, as it was the last chance, I purchased a box at the druggists and used it as directed and before the box was used up the cut was entirely well. I intend to keep a supply on hand for emergency cases if I have to pay a dollar a box for it. Please accept my thanks for the good I have received from its use, and if you choose you can use my name and testimony.
W. S. CAMPBELL.
This penetrating, stimulating, soothing, absorbing, antiseptic, healing ointment heals from beneath the surface by disinfecting the parts, subduing inflammation and stimulating healthy granulations, not by drying and scabbing, and stimulates growth of hair, natural color. Makes quick, clean and healthy cure; heals stinging, burning, chronic saddle and collar galls, hopple chafes, abscesses, caked bag, cow pox, and hoof rot. It penetrates, stimulates, sooths and heals while horse works. Money refunded if it fails.
Price, 2-oz. box 25c; 8-oz. box 50c; 5-lb. pkg. $4.00, at all druggists and dealers or sent prepaid.

Binghamton, N. Y.

Chicago's New Milk Law—Strict Provisions Governing the Handling of Milk.

The Chicago City Council passed a milk ordinance at last week's meeting that will be signed by the mayor and become a city law.

Under this ordinance skim milk must be carried in cans that have been painted red. The ordinance provides that all cans, vessels and receptacles used in the handling of milk and cream, as well as all packages, refrigerators, or compartments of stores or other places where milk or cream is kept, shall be maintained clean and free from the presence of any article likely to contaminate sweetness of the fluids.

All cans, vessels, and receptacles must be sterilized with boiling water or live steam each time they are used.

All bottles in which milk is distributed must be cleaned and sterilized each time used, and the same treatment must be given all pouring cans, dippers, and other vessels used by peddling, at least once each day.

Shippers' cans can no longer be used for storing milk, but must be returned clean within thirty-six hours after being received by dealers. Heretofore, cans have been held so long at times that on return to shippers and dairymen, boiling in lye has been required to remove the fermenting material formed.

Violators of these rules are made liable to fines ranging from $5 to $200.

Under the same penalty, all vehicles used by distributers must bear signs stating the name and place of business as well as plates showing the license numbers. If any dealer attempts to dodge the "red can" and foist skimmed milk as the whole product on his customers, he meets the same penalty—a fine of $5 to $200. Any mixtures of milk, as whole milk with condensed milk or buttermilk, must be carried in cans especially marked. Impure or diluted milk found will be immediately destroyed; first offenses bringing a fine of from $5 to $100 and subsequent offenses drawing fines of $50 to $200. There are heavy fines provided for dealers being found in possession of or attempting to use preservatives.

In his address on "Dairying in Foreign Countries" before the New York farmers, Major Alvord has the following to say in regard to the readiness with which the European farmers buy outside feeds for their cows:

"Very skillful feeding may be observed in many of the dairying districts of foreign countries. The owners seem to know how to obtain the maximum product from their cows with the minimum expenditure of forage. From Norway to Italy and from Iceland to Siberia the poorest peasants do not hesitate to buy concentrated cattle foods when necessary to supplement home supplies. The purchases are made judiciously, and the feeding is equally so."

For the land's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it.

GOOD INTENTIONS ALONE CANNOT PRODUCE GOOD MACHINERY. Most all manufacturers are honest, but lack the experience and equipment necessary to turn out a thoroughly first class engine. We are the founders of the Gas Engine industry in the United States; have been building **OTTO** engines for 27 years, and operate the largest and most complete plant in the country devoted exclusively to the building of Gas and Gasoline Engines. Which will you buy, **Otto Experience** or **Others' Experiments**

It's a Sad Mistake

not to use some preparation to stop the dreaded fly-pest on cattle.

Cow-Ease

Will Keep the Flies Off

THE WAY TO PUT IT ON

quiet the creature and make milking a pleasure. It increases the flow of milk, too.

CARPENTER-MORTON CO., BOSTON.

Ask your dealer. If he hasn't got it, will send gallon can, express paid, for $1.00.

Rippley's Fly Remover

Instantly removes all flies, mosquitos, lice and other insects from cattle, horses and other animals sprayed with it. It is healing to any sore. Animals rest easy and feed quietly all day. Cows give ¼ more milk, which is a big saving. 1 gal. will protect 500 cows. Endorsed by the best class of people. Order at once and secure agency, you can sell hundreds of gallons. 1 gal., $1.10; 2 gal., $2.10; 5 gal., $4.50; 10 gal., $9.00. RIPPLEY'S Special Sprayer for applying same, 65c; 4 gal. Compressed Air Sprayer for applying same on large herds, $5.00; 5 gal., 5.50. Money refunded if not as represented. Our Breeders' Supply catalog mailed free; tells how $8.00 per head can be saved by using Fly Remover; ½ bbl. lots of 30 gal., $25; freight paid on 20 or 30 gal. lots.

Gentlemen:—For three years I have been experimenting with different things to keep flies off my cows, but not until I tried your Fly Remover and Compressed Air Sprayer was I successful. I used this last year and found that it costs less than one cent per week per cow. With your Compressed Air Sprayer it takes but a few minutes to put it on, and the result has been that my cows were free from flies, and during the year gave 6400 pounds of milk each, which made 324 pounds of butter per cow. I can heartily recommend it to all stock owners.—JOHN ARMSTRONG, President State Board of Agriculture, De Smet, S. D., June 4, 1901.

RIPPLEY HARDWARE CO., Box 20, GRAFTON, ILL.
Western Office, Watertown, S. D.

SHOO-FLY THE ANIMALS' FRIEND

Goodwin's

Use Goodwin's Fly Killer this season on your cows and horses and be rid of the fly pest. Cows give 25 per cent. more milk and horses are relieved. Gallon 75c, 5 gallons $3.00, 10 gallons $5.50. Sprayers 50c, or send $1.00 for sprayer and enough Fly Killer to protect 150 cows.

T. D. Goodwin & Co., AGENTS WANTED. Columbia Station, Ohio.

Notes of the Season in Southeastern New York.

ED. HOARD'S DAIRYMAN:—The spring and summer of 1903 in Delaware county, New York and adjacent counties will go on record as anomalous and without a parallel in many respects.

The oldest inhabitant, universally I think, concedes that never in his or her memory was a March known, that throughout the whole month so nearly perfect spring weather prevailed.

The first of April it looked as if an early growth of pasturage was almost assured, but cold, dry weather throughout that month and the following one, with frosty nights, brought about a complete change in conditions, and farmers, as a rule, began to feel badly discouraged from the prospects of the most serious shortage in the hay crop in many years.

In fact, many began to prophesy a complete failure and even a famine and all through May the cows were held on nearly or quite their winter rations of grain, as there was practically no growth in pasturage, except it might be on very limited areas on lands that were sufficiently moist to endure a long protracted drouth.

At the beginning of the first full week in June, however, a change came and with sufficient rainfall during the remainder of that month, to thoroughly soak the ground and fill up the shrunken streams, there has been an almost phenomenal growth of grass, and at the present date (July 6th) there is promise for nearly an average hay crop, though haying will be from two to three weeks later than in the ordinary season.

A large area has been planted to corn, millet, etc., as supplementary feeds and a great many new silos are being built throughout all this dairying region, for while the Bordens still continue to hold their restrictions against milk from ensilage fed dairies, the success of many of our co-operative creameries has encouraged the farmers to think and act more for themselves and they are disposed to assert an independence as to these feed restrictions, they would not have shown a few years since. Oats and potatoes are looking well and with a large acreage of the former crop as compared with recent years.

Corn is small and late in starting, due to the lack of warmth and sunshine during June, but July and August are our corn months here and with favorable weather during these two months there is a chance for a good crop of this cereal for this locality. E. J. BROWNELL.

Delhi, N. Y.

Pasteurizing Small Amounts of Cream.

ED. HOARD'S DAIRYMAN:—Have a cream separator and wish to sell my cream and ship by rail, 50 miles.

Can I pasteurize the cream, and which is the best machine for the work?

Grand Rapids, Mich. C. B. F.

Pasteurizing on a small scale without proper machinery is not practical. It can be done, but the results, unless an experienced man is operating, are not satisfactory. There must be plenty of cold water and ice in Michigan, and if the milk and cream are kept cold and proper attention is paid to cleanliness of stables, cows and milk utensils, there should be no trouble in getting the cream to the city, in a sweet condition. Raw cream is always better than pasteurized, and clean raw cream will keep sweet long enough for consumption.

As a matter of history the following is interesting to put on record:

A German scientist in 1859 demonstrated in a crude way, that such a thing as separating cream from milk by machinery was possible. In 1864 a brewer in Munich, Germany, invented a machine that raised cream in jars by means of centrifugal force. In 1870 a minister in Massachusetts made the first successful attempt to separate cream from milk. This was done by means of two glass jars attached to a spindle which revolved 500 times per minute. It required one hour to raise the cream. At about this time, LeFeldt & Lentsch of Brunswick, Germany, exhibited a machine in which was obtained a thick layer in twenty minutes, making 700 revolutions per minute. In 1877 a patent was granted to the last named parties for a machine to separate cream from milk by centrifugal force.

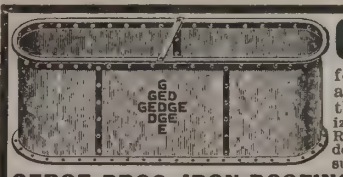
IF there is an impression in the minds of any that Mixtures of White Lead and Zinc are better than Pure White Lead, it has been created by the manufacturers of the Mixtures, because a much larger profit can be made from the sale of these than by grinding and selling either White Lead or Zinc *pure*.

If interested in paint or painting, address

National Lead Co., 100 William Street, New York.

SAVES ITS COST ON THE FIRST CROP.



It spreads all kinds of manure, lime, salt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.

Do you know of any other piece of machinery for use on the farm of which this can be truly said?

The Improved Kemp Manure Spreader

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new **Beater-Freeing Device, Apron-Returning Device** and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about **"How to Grow Big Crops."** Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court. KEMP & BURPEE MFG. CO., BOX 46, SYRACUSE, N. Y.

GALVANIZED STEEL TANKS

for Stock, Storage, Towers, Dipping, Wagons, etc. Shapes and capacities to meet any want. Differ from all others in their perfection seams and keeping shape. Heavily galvanized. MINNEAPOLIS, MINN.

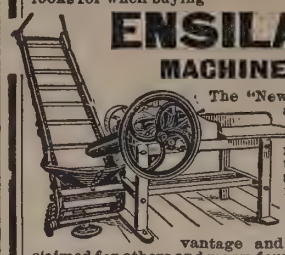
When ordering mention this paper.

CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.



CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true**. All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

"NEW HERO"

excels in strength and effective working qualities and sells at a price that "fits the purse." It is the combination of these three features in the highest possible degree which a practical man looks for when buying

ENSILAGE MACHINERY.

The "New Hero" Cutters are the simplest in construction of any made; so strong that, size for size, they weigh more than any others; they have every practical advantage and improvement claimed for others and many found in no other; they are guaranteed to outlast and outwork others. Sizes, 9 in. to 26 in.; with or without self-feed table; shredder attachment if desired; swivel feed carrier. We make also a complete line of sweep and tread horse powers, shellers, huskers, feed grinders, wood saws, windmills, etc. Remember that Appleton quality is the standard of excellence, and write to-day for free catalog.

SMALLEY SAFETY BLOWER

Only One Belt Required.

No lost power. No danger in operation. Belt cannot slip. Every part strong and of best material. No more strain on the *Smalley* machine when Blower is attached than with the ordinary carrier. Largest size machine will easily handle ten tons of ensilage an hour, cut ¾ inch and elevate into any silo. Send for 1903 catalogue, tells all about our goods. We also make complete line of drag and circle saw machines, sweep and tread powers.

6 sizes self feed. 12 sizes of hand feed.

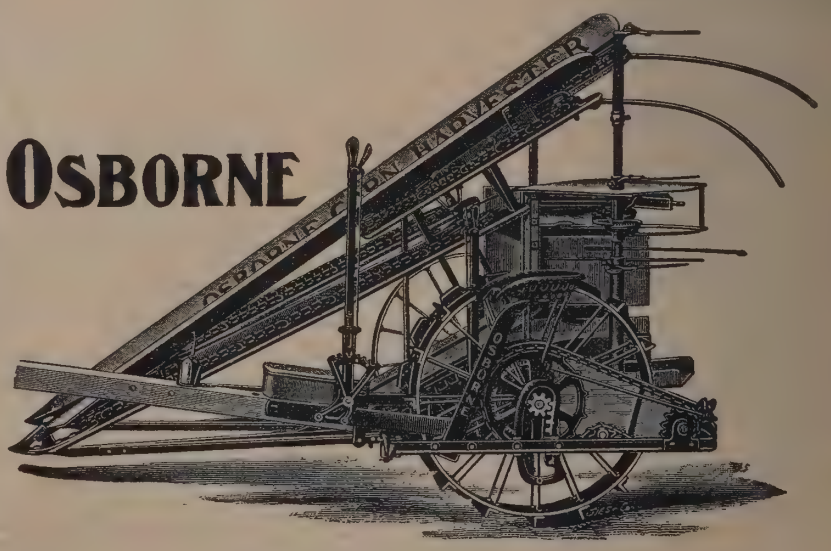
SMALLEY MFG. CO., Box H, Manitowoc, Wis.

D. M. Osborne & Co., St. Louis, Mo. Caledonia, Mo, June 1, 1903.

My Dear Sirs—I feel I honor my own judgment, and reflect only that which is justly due your corn harvester, when I say it is without doubt the best corn harvester on the market to-day. Last season I cut, on my own farm, 115 acres of corn, and a negro boy 16 years old managed the machine, drove the horses and did all the cutting, without one cent expense for repairs or breakage. The work could not be excelled. The corn was heavy and much of it down, and some full of weeds, but it made no difference to the machine. All corn looks alike to an Osborne Corn Harvester, and to Missourians your machine is peculiarly adapted, for it can most certainly "show them." I am, Yours very truly,

W. R. GOODYKAUNTZ,
Ex-Senator of Missouri

"OHIO" STANDS FOR BEST



The 1903 "Ohio" Blower Elevators solve the blower problem. The best in the past, they are still further improved, and will unquestionably cut and elevate the most feed or ensilage for the power required. "Ohio" machines **work**, and our absolute guarantee goes with every machine. New **Patent Applied For** interchangeable Shredder Blade for all sizes. Everything complete in one machine.

To know all the good points you must have our new 1903 catalogue or ask the man who has an "Ohio." Thousands of "Ohio" machines have made thousands of satisfied owners. Self-feed increases capacity 33⅓% and saves 75% labor feeding.

OSBORNE

This Corn Book tells about Silos and Fodder. Book Free for the asking.

Scotia, N. Y., April 15, 1903.

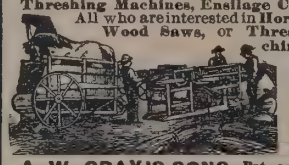
D. M. Osborne & Co., Auburn, N. Y.

Dear Sirs—I am well pleased with the Osborne Corn Harvester I purchased of your agent, C. H. Bevis, last fall. It proved to be all it was recommended. On account of the season, several places in our corn fields were deep mud, but when we cut there the machine worked just as good. The broad-faced steel drive-wheel is a great advantage on ground where it is soft. We used only two horses, and did the work easier than some of our neighbors did with three horses on another make of machine. It is certainly a very light runner. It is also a fine binder, never once having broken the twine, or missing to tie, thus using less twine than others, besides delay and trouble. I would say, in a word, that the machine is practically perfect. Very truly yours, CHARLES P. SANDERS.

BLIZZARD

Feed and Ensilage

Cutter



Does everything, cuts hay, straw, ensilage, shreds fodder and fills the silo to any height; all done by one machine. Sold on full guarantee. Write for catalogue.

All The Year Round

Just at this time when some of the cream separator manufactories are shut down entirely and others running with reduced forces the **Sharples Cream Separator Works,** the largest in the world, continues to run at full blast and to turn out more separators every day than some competitors build in a month. The demand for the famous **Sharples Tubular Dairy Separators** is as stable as the demand for bread and butter. At no time for the past six months have we been able to keep up with our orders, notwithstanding the fact that each day we complete and send out more separators than any competitor.

Every working day of the year finds us loading car after car of the **Tubular** separators. Why is this great demand? Because the **Tubular** is different from other separators---so different that we could not begin to tell the difference here. Write for our new catalogue No. 144.

COOLING MILK FOR CITY TRADE.

There is a continuous complaint that in the summer, milk and cream shipped to the city does not keep well and there is much loss from souring even before it reaches the consumers. This result is of course due to bacteria contained in the dirt that falls into the milk during milking, and from contamination by poorly cleaned milk utensils.

Aside from the necessity of cleanliness much of the trouble would be prevented if due attention was paid to proper cooling of the milk as soon as it is produced. It is a custom among dairymen to put one or two cans in the watering tank and depend on the water in the tank to cool the milk sufficiently. How little dependence can be placed on this method is shown by some experiments at the Maryland Experiment Station of which the following is the conclusion:

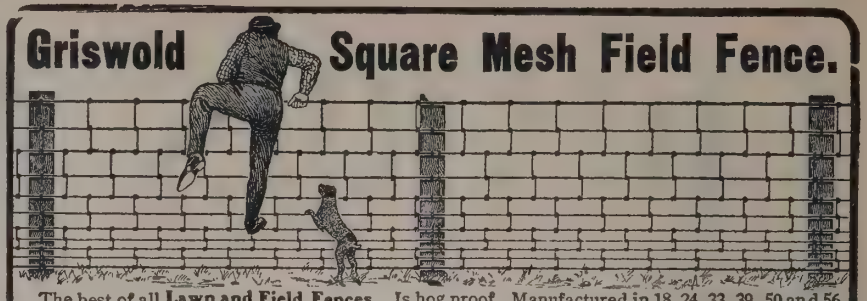
The experiment shows that milk set in a tub or tank of water at 65 degrees, the milk having no previous cooling, could not be depended upon in warm weather to keep longer than twenty-four hours. The milk cooled immediately to the same temperature, kept from thirty to thirty-five hours. There would, of course, be considerable variation in the length of time the milk would keep when set in the water, depending on the character of the weather, whether it were cool or hot, as this would make considerable difference in the ultimate temperature of the water and milk. It is doubtful if, in ordinary weather, milk could be kept at this temperature for longer than twenty-four hours without an impractical amount of care bestowed in another way. The most important lesson to be gathered from this work is that a temperature of 65 degrees cannot be depended on to keep milk for a sufficient length of time to get into the city market without the shipping point is close to the city and the milk is shipped twice a day. This is important to producers, for they get careless about the temperature of the water that is used. Even if the well furnishes unusually cool water, if it is allowed to stand for any length of time during a hot day it will soon get above the danger point, and for this reason it is a necessity that the water be pumped fresh for the milk at the time that the milk goes into the tank. Of course, where running spring water is used this point does not need to be guarded against, but it is something that the man who uses well water and has no ice, needs to look after very closely.

Short-horns Will Be Represented in Dairy Test at St. Louis.

Association Will Bear All Expenses and Give Prizes.

It is proposed by the Louisiana Purchase Exposition to conduct a demonstration of the dairy and other qualities of the various breeds of pure-bred cows, including the dual-purpose breeds and their adaptability for dairying and beef production, illustrating in a practical way how economically the products of the cow can be obtained under given conditions. Each of the cattle breeders' associations has been invited to furnish cows for this purpose, and at a meeting of the directors of the American Short-horn Breeders' association held in Chicago recently it was decided to participate in the dairy demonstration, provided H. H. Hinds of Stanton, Mich., who had charge of the dairy test at the Columbian Exposition, could be secured to look after the Short-horn interests at St. Louis next year. This Mr. Hinds has agreed to do, and Chief of Department Coburn has been notified that the Short horn cow will be on hand, prepared to demonstrate her milk and beef qualities.

All entries from associations must be filed with the chief of the live stock department on or before July 1, 1903, and from individuals on or before Dec. 1, 1903. The demonstration will be divided into four classes—viz., A, B, C and D.



Class A will consist of cows entered for demonstrating the economic production of butter fat and butter.

A Suggestion for Arranging a Large Stable.

Ed. Hoard's Dairyman:—We have just completed our new barn (for registered Ayrshire cattle) except cementing and putting in cow and horse stalls, and would like information regarding putting in of same. We have obtained much valuable information on different agricultural topics from your paper.

The accompaning plan will give some idea of the barn. It is built after the Shawver plank frame system. It is situated east and west, is 40 ft. 6 in. by 160 ft., on ground that is nearly level. We intend cementing it throughout and intend to put in the King system of ventilation. H. B. Smith.

Chateaugay, N. Y.

We give in figure 1, a reproduction, on a reduced scale, of the plan submitted by our correspondent for sub-dividing this large barn. It will be noticed that there is a hay bay on the west end, 20 feet wide, then a driveway or barn floor 16 feet wide, then stabling for cattle and horses 104 feet long, and at last a carriage house 20 feet wide. These measurements, however, take no account of the walls or partitions which reduce the available space to some extent.

Before submitting our own suggestions, it may be well to point out a few of the objections to the plan submitted, as they appear to us. Possibly, the most serious objection, according to our judgment, is the absence of any arrangement for driving through this barn from end to end; or any other way to get a wagon or sled in front of the cows for distributing feed, or in the rear for removing droppings.

The second objection, is the apparent absence of any convenient and expeditious way of getting the cattle either into or out of the stable. The plan seems to indicate that it was intended part of the cows should enter the stable from the so-called barn floor or driveway, and another part from the carriage room. It seems to us that such an arrangement is greatly lacking in convenience and in safety. Another objection is that the plan, as submitted, does not seem to provide any box stalls for bulls, cows or calves. Possibly, it may have been intended to use some of the space marked for cows for these purposes.

A fourth objection for us would be that the arrangements are for the cows to face inward. We would prefer to have them face outward, with feeding alleys in front and a central driveway for removing excrement. We are well aware that in this particular our views do not correspond with those of many others for whose judgment we have great respect; but when asked to submit suggestions, we must be guided largely by our own judgment and experience rather than by the judgment and experience of others.

As an incident to the objections suggested above, we may mention that there does not seem to be any convenient way of bringing these cattle into a common yard.

Without going into further detail, we submit a plan for sub-dividing this stable which seems to us to present a good many features that are improvements over the plan submitted by our correspondent.

It will be observed, as a very radical departure, that we omit the hay bay entirely. We do this, not alone to get an opening on the east end through which wagons can enter and leave, but for the further reason that the location of this hay bay brings the fodder so far away from many of the cows as to make a great deal of travel back and forth. We do not think this dispensing with the bay will be a very serious objection, as the loft over the stable will, in all probability, hold all the hay that may be required; and if it should not, we should much prefer to erect somewhere else a hay barn or even to stack the hay.

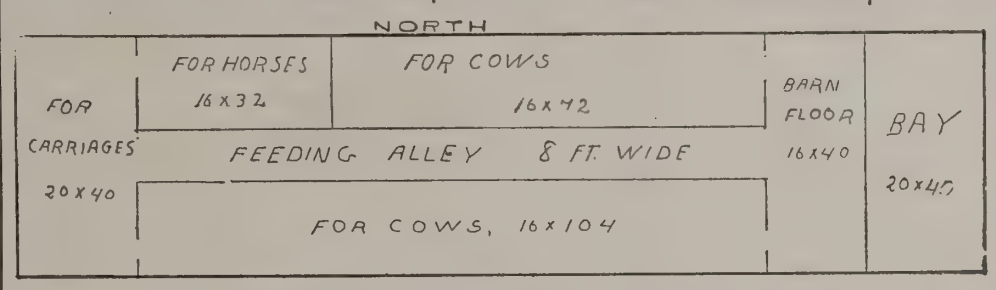

Fig. I—Stable Plan as submitted by owner. Dimensions, 40×160 feet.

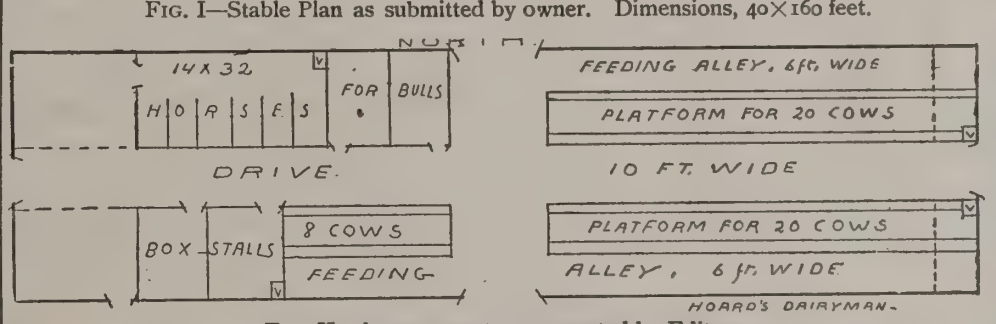

Fig. II—Arrangement as suggested by Editors.

Our next suggestion is to remove the barn floor or driveway from the location suggested and place it substantially in the center of the building. Thus located, it will afford a more convenient place for driving in with loads of hay and distributing it to either side, and what is of perhaps greater importance, a more convenient arrangement for allowing the cows to enter and leave their stalls. It also provides a convenient arrangement for storing the different qualities of hay in a manner so that they can be reached as occasion may require.

Our plan of sub-division gives the same number of lineal feet for cow stalls as found in the original plan, and in addi- provides four commodious box stalls for cows, calves and bulls. Our own judgment is that the number of box stalls should be increased, and to that end, we would provide for one or more on either side of the central alley at the east end of the barn.

Consistent with our own views, we also suggest that the cows shall face outward rather than inward, and that there should be a central driveway ten feet wide, with a door of same width in either end of the barn. On either side of this central driveway we would have a gutter about 18 inches wide and four inches deep on the sides next to the driveway, and coming up level with the concrete floor on the opposite side. Our standing platform for the cows would be 4½ feet wide, connecting with mangers two feet wide, and thus leaving a clear space of six feet in width for feeding alleys.

It may be all right to have a cement or concrete floor throughout the entire building, but we very much object to compelling cows or other animals to stand on such a floor. We, therefore, would cover the standing platform with 2-inch plank which will add very materially to the comfort of the stock.

We would locate ventilating shafts as shown in the diagram, one on either side of the driveway at the west end, about 3×4 feet in internal dimensions, running up into the loft and then brought together into a central flue reaching up through the ridge. Locate another flue, as shown, in the corner of the horse stable and another one in the corner of one of the box stalls. These flues can run up to the rafters and then be carried along between the rafters to unite in a common exit at the ridge.

It will doubtless be observed that neither in the original plan nor in our suggestion has any provision been made for storing feed or for stairways leading to the loft. These are very important and practically indispensable items, although ladders may take the place of stairways, but some arrangement should be made in the loft or elsewhere for bins for storing feed.

The Art of Milking.

There is no branch of dairying which has received so little attention and close thinking, whether on the part of the dairyman himself, or the scientists who are investigating dairy subjects, as the important item of drawing the milk from the cow. In a general way, we all know that the manner of milking has much to do with the profitableness of cow keeping. We all know that there are good milkers and poor milkers. but just why one person is a good milker and another is a poor milker, it has been deemed impossible to determine, and still more impossible to describe.

As in so many other matters, it has remained for little Denmark to take up this subject in a careful, painstaking, inquisitive way, and among other attempts to solve the milking problem, the Agricultural Society in the County of Svendborg, a couple of years ago, arranged a competition for writing a short and popular article about the work of milking. From among the manuscripts submitted, that of Mr. Jorg. Peterson, head master at the Agricultural College of Dalun at Tyen, got first prize, and some thousands of copies were printed for distribution in that little kingdom.

From a translation of this essay, for which we are indebted to one of our English exchanges, we select and condense as follows:

It is a general rule, appropriate to all living beings, that the use of an organ of the body promotes the development of that organ; this rule is thus also appropriate to the organ of the cow which we call the udder. The use of it is the milking, and in that we have the most important and best means of developing the udder of the cow, and at the same time also her milking power. But in order that the use of an organ may produce a higher development of it, it is also required that it will exert the organ. The exertion of the udder consists of milking it perfectly free from milk. The milker must take as an example the greedy calf, which sucks the very last drop of milk out of the teat. This causes an increase of blood to the glands of the udder, and this is evidently of the greatest importance, knowing that it is from the blood all material for further development and for more milk is got. But, above all, is evident the importance of clean milking young cows or heifers, the udders of which are still growing and developing. What a good milker has to do, is not only to get out all the milk that is in the udder, but also to do that in such a manner that the cow feels it as an enjoyment, and further to take care no dirt or impurities get into the milk.

Before beginning milking, the milker ought to speak kindly to the cow, pat her and caressingly smooth her along the belly and the udder. The milk pail is then placed under the udder on a certain side of a cow, and he takes, with full hand, hold of two of the teats, one fore and one hind teat to be preferred. The hands are alternately moved upwards to the udder by a gentle pressure, and then, also alternately, slowly and lightly, closed downwards round the teat. These grasping movements are continued till he perceives that the cow yields the milk, when the latter is got out of the udder in long, consistent streams; the movements of the hands are the same as at the beginning, only a little more vigorous. For every new movement the hand must make a pressure up against the udder, and, at the same time, the thumb and forefinger shall seize the part of the udder which is next above the teat, in order to get as much milk as possible from the part where the milk reservoir is the largest.

During this part of the milking the conscientious milker must give all his attention to his work, for every interruption in it means loss of milk. All noise and loud conversation must, therefore, be strongly forbidden during the milking, as disturbing to both cow and milker. When the first pair of teats no longer yield any milk, he proceeds in the same manner with the second pair. The milk must be squeezed, not pulled, from the teat. The latter must, therefore as before mentioned, be taken in the whole hand, which must not more than is absolutely necessary glide along the teat. "Streak-milking," by which the upper part of the teat is squeezed between the thumb and the fore-finger, or, worse still, between the fore-finger and the middle finger, and then the fingers, tightly pressed, drawn downwards, is very objectionable. It is disagreeable to the cow, irritates the skin of the teat, and may easily cause sores; but not only that, it may even cause bursting of the mucous membrane of the milk-cistern and thereby cause a serious illness in the udder. A hard-handed milking often causes perturbations in the secretion of milk; in that way a cow may, for instance, become hard milked; a teat may from the same cause easily be made quite useless, and a cow become what is called three-quartered.

But milking the cow is not yet completed. An effective after-milking must take place, by which the milker by means of suitable manipulations must work and knead the udder to press the last drops of milk out of the teats. A great many examples could be told about the influence of clean-milking upon the quantity and quality of both milk and butter. In Germany the experimeut has been tried of allowing one person to milk five cows during fourteen days, and then another person milk the same cows during the following fourteen days. The cows were fed and served during the whole time in quite the same way. The result, however, was that the second person on an average got about 2 kilograms (4 lbs. 6½ oz.) more milk per animal per day than the first one. At a similiar experiment made in America by Prof. Babcock, Wis-

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

PRODUCING cream with the same per cent of fat from day to day, is one of the things that verges on the impossible. There are too many things that cause variations. The speed of the separator bowl affects the cream by making it richer as the speed increases. Equally, a slower motion makes a thin cream thinner. So where a hand separator is used, there is no guaranty that an even motion is kept up, and the uneven motion produces an uneven cream. If the separator is crowded with a full milk flow and then for a short time the supply is lessened, the result is first a thin cream and then a thick cream in small amount. The separator is not infallible in its cream product, and the fact should be recognized.

"DAY unto day uttereth speech and night unto night sheweth knowledge." Thus wrote the Psalmist several thousand years ago. Probably he did not have in mind the problem of dairy farming, but his words apply there as well as elsewhere.

The business of keeping cows is full of speech, if those who follow it have ears that are willing to listen; and it abounds in knowledge, if they will but seek for it.

How clearly Solomon understood the value of intelligence as a factor in successful farming, for he says in Proverbs: "I went by the field of the slothful, and by the vineyard of the man *void of understanding* and lo, it was all grown over with thorns, and nettles had covered the face thereof, and the stone wall thereof was broken down."

A more graphic description of shiftless farming has never been given.

IN noticing that a number of farmers near Grout City, Mo. had formed an association to be known as the United Dairymen of Missouri, New York *Produce Review* asks the very pertinent question: "Why don't they join the State Dairymen's Association?"

One of the most potent causes which have led to the development of the State of Wisconsin as a dairy state, has been the steady and united loyality which has been given to its State Dairymen's Association. Our dairy farmers have held together and worked together, thus securing liberal grants of money from the legislature, and thorough good work. Farmers as well as men in other vocation must learn how to work together. "United we stand, divided we fall."

BARLEY FOR DAIRY COWS.

How many dairymen have seriously experimented with the feeding of barley to their cows. The Wisconsin Experiment Station is on record in recommending it as very profitable feed. It taxes the land less than oats, is a surer crop and much better to seed timothy and clover with. There is a great lack of thorough experimental work in determining the feeding value of this truly valuable grain.

The South Dakota Experiment Station tried an experiment in feeding barley, and the grain called spelz to lambs. Twelve lambs were fed fifteen weeks on barley and another bunch of twelve were fed the same period on speltz. The lambs on speltz consumed 2,244 pounds of grain and gained 300 pounds. Those fed on barley consumed 2,318 lbs. of grain and gained 455 pounds. With speltz it took 7.47 pounds to produce a pound of gain. With the barley it took 5.9 lbs. for a lb. of gain. The DAIRYMAN would like to hear from any of its readers who have fed barley meal to their cows, as to their opinion of its value and efficiency as compared with oats.

A LESSON IN AGRICULTURAL DEVELOPMENT.

The American people are fond of calling themselves great. They have a right to this term if they mean the size of their country, the number of its inhabitants, their bravery and determination, or the spirit and purpose of American civilization. In all these things we are great. And we are great in some other things. We are great in the heedless, wicked waste of the stored up fertility of our farms, in our disregard as farmers of the teachings of science, in our foolish contempt of the wisdom that comes from study, thought and organization. We are great in our conceit that we have no need to learn of other nations concerning the conduct of our farms. In every other vocation of American life but the farmer, the white light of all the study, all the invention, all the improvement that is made in other nations beats full and strong on every effort. In manufacturing, a new invention in one country is soon taken advantage of in every other. The progress of chemistry, or indeed of any other science, is closely followed, and felt by every person engaged in that science all over the world. And so it is in law, medicine, literature, commerce. Each worker in these fields soon feels the effect of every advance made by his fellow worker even in the most distant parts of the earth.

The secret of this wonderful oneness is found in the influence of the printing press. Here is the heart of the universe, which sends new blood to all the members of the great body of human thought and interest everywhere.

These thoughts are prompted somewhat by reading in the May *Independent* of the achievements in agriculture and agricultural organization in Denmark, written by Baron de Stampenbourg. It is a wonderfully impressive story and shows with marvelous clearness how a small body of farmers, by working in intelligent unison, can greatly promote their welfare, and take possession of the markets of the world. We have room for only a brief mention of the many lessons this description by the Baron conveys.

In the first place, Denmark has no foreign policy; she does not concern herself with being an outside "world power." Every effort of the government and the people is directed to the development of her agriculture and other industries. Here are some of the results of that wise policy in the last five years.

Butter exports have increased from 1,000,000 to 20,000,000 pounds anually; fish exports from 750 pounds to 3,000,000 pounds; egg exports from 4,000,000 pounds to 20,000,000 pounds; meat exports have jumped from 500,000 pounds to 160,000,000 pounds. To equal this, in proportion, the United States would have to export five and a half billion pounds. The Baron says that the economic progress in Denmark is almost entirely due to the efforts of an enlightened farm peasantry through co-operation among themselves. "No arrogant trust" has arisen to dicate prices and blight competition; and no "community of interests has been allowed to create artificial values at the expense of the interests of the commonwealth."

More than five-sixths of the land belongs to the peasants. In the Baron's words: "You see every where small, well kept farms, with fields and meadows as scrupulously cultivated as if they were horticultural garden exhibits."

Now we come to the most interesting part of all. What has made of the Danish farm peasant such a mighty force for the regeneration of his country and the promotion of his own good fortune? We will let the Baron tell the secret in his own language:

"The success of the Danish peasant is due *first of all* to a splendid system of *rural high schools*, and a very practical plan of economic co-operation. The schools teach every branch of agricultural science in connection with a liberal scholastic curriculum, insuring a well rounded education. The schools are open to everybody, young and old, and not infrequently men of more than forty years of age attend the classes. The future farmer is taught the things he ought to know to be successful, * * *. The man who has been swinging a scythe all day may be found in some evening class studying forestry and creamery methods, and many employers allow farm hands to "knock off" work for a couple of hours in the afternoon to attend the high school of the township. These rural colleges have made out of the present generation of Danish peasants, the most enlightened, the most thoroughly instructed and the most permanently industrious of farming communities."

What a splendid picture! What intelligent farmers! What magnificent results! We wondered while reading this, if there could be found in all Denmark a single farmer who sneers at "book farming"; who despises the knowledge that agricultural books and papers and agricultural schools can give.

Denmark is the most advanced dairy community in the world. All the methods of farm and cattle management, machinery, methods of handling the milk, making the butter, and the commercial system of disposing of the same are the results of intelligent co-operation between the farmer and the student of dairy science. Then, besides, as we have seen, the Danish farmer takes care to provide that his children and himself shall have real agricultural country schools, where their minds, as well as their hands, can be developed and grow strong. The Baron closes this remarkable article in these words:

"A 'tight, little isle' forging quietly ahead, in the dogged belief that knowledge is power."

WARMTH AND VENTILATION.

We have a recent inquiry as to the best methods of ventilating a stock barn without interfering too seriously with the warmth of said barn. Of course, we could give no specific advice without knowing about the size of the barn and its general arrangement, but the concluding part of the query raises a question of general importance.

There is evidently more or less of a misconception in the minds of a great many people as to the effects of ventilation, when provided for in the proper manner. The truth is, that a properly ventilated apartment, whether it be in the dwelling house or the barn, is warmer in every way than the unventilated apartment. Some years ago, the present writer built quite a large chimney from the cellar bottom up through the center of the house and provided a small fireplace in the main living room which connected with two other rooms. At that time he was heating his house with stoves, and much to his surprise, he found that the one stove in the living room did more effective service in warming that and the connecting rooms than it had done before the large chimney was built. The reason for this was not far to seek. The fireplace not only drew off the cold air which inevitably is near the floor, but in doing this, it created a circulation throughout all the apartments and permitted the overheated air at the ceiling to come down.

The King system of ventilation applies this principle to stables. It provides for a large flue or shaft, with an opening at the floor, which draws off the coldest air there is anywhere in the stable. Fresh air, even in cold weather, is admitted at the ceiling, but before it reaches the floor, is warmed by the warmer air with which it comes in contact. The inlets for fresh air should be fairly well distributed so that the cold air may be admitted at different places; and, beside this, there should be a downward flue opening exteriorally not less than three feet lower than the opening on the interior. This is to prevent the warm air at the ceiling from escaping, and thereby compelling it to descend and take the place of the colder air drawn off by the ventilating flue.

It follows, therefore, that ventilation, instead of interfering with the warmth, actually contributes to it. The heat given off by a stable full of cows is more than sufficient to warm the stable, provided it be equably distributed. This it is the province of ventilation to do, in addition to the admission of fresh and pure air, and the withdrawal of the foul and cold air.

Estimating Butter.

The Jersey Bulletin, as its name implies, cannot well be an independent paper, and it was perhaps too much to expect that it would treat with respect or candor the recent decision of the Holstein-Friesian Association, in the matter of making up its records of tests, and the changes adopted to bring the future records of Holstein cows into accord with the opinions and practices of the experiment stations. Neither was it to be expected, perhaps, that it would correctly report the attitude of HOARD'S DAIRYMAN on this subject.

For example, in its issue of July 15th, it says "HOARD'S DAIRYMAN, particularly among newspapers, upheld by a few so-called 'scientific dairy authorities,' has continually abused Jersey men for not doing the very thing which has put the Holstein records beyond credence." Of course, as the *Bulletin* well knows, there is not a word of truth, not even a suggestion of truth, in such a statement. HOARD'S DAIRYMAN has never abused Jersey men. More than this, it has never advised Jersey men to follow the example of Holstein men in those particulars which have put Holstein records beyond credence. On the contrary, from the first, it has not failed to warn and reproach Holstein breeders for the unscientific and impracticable rules adopted by their Association for estimating the amount of butter a cow was capable of producing, as shown by the Babcock test. The persistency of its opposition to the practice of adding one-fourth to the amount of butter fat for estimating the possible yield of butter, has not only cost the paper very considerable patronage, both in its subscription and advertising departments, but what has been more keenly felt by the editors, the good will and sympathy of many personal friends,

However, in this respect, as in so many other respects, the paper has continued to hew to the line, and to proclaim the truth as it has been given to its editors to perceive and apprehend the truth. It does not care to boast, but a careful review of incidents leading up to the action of the Holstein-Friesian Association at its last annual meeting, will show that HOARD'S DAIRYMAN has been perhaps the most efficient factor in bringing about this action.

The editors of this paper do not claim to be infallible, but they are not such idiots as to advise Jersey breeders to adopt those Holstein practices which they are continually condeming.

HOARD'S DAIRYMAN is much gratified to observe that the American Jersey Cattle Club, notwithstanding the opposition of the *Jersey Bulletin* like the Holstein-Friesian Association, is adopting from time to time, suggestions made to it through its columns. It has recognized the Babcock test as a more just and unfailing arbiter than the churn for determining the butter making capacity of a cow, and today, a churn record not confirmed by the Babcock test, obtains little credence among Jersey breeders. Not only can the churn be so manipulated as to give the cow credit for more than she is justly entitled to, but quite as frequently perhaps, the churn cheats the cow, gives her less credit than she is entitled to. In the same issue of the *Jersey Bulletin* from which we have quoted above, there is a report of two cows tested, both by the Babcock and the churn. Butter from one cow contained 83.57% fat, the butter from the other cow contained 88.2% fat. Such variations as these by the churn are far greater than the variations in the Babcock test.

What HOARD'S DAIRYMAN has insisted upon is that the cow shall have credit for all the fat she puts into her milk and then when we want to express this in pounds of butter, that there shall be added one sixth to the fat, no more and no less, for it has been demonstrated over and over again that this is what the cow is entitled to.

Brewers Grains as a Feed for Milch Cows.

We are in receipt of frequent inquiries as to the effect of brewers grains upon the flavor and quality of milk. There seems to be no end to the number of times questions of this character can be repeated. Fed in reasonable amounts, when fresh from the brewery, or if kiln dried, there can be no possible objection to their use, and when they can be purchased at any fair price, there is no reason why dairymen should not use them. Twenty to thirty pounds, per day, of the wet grains, is perhaps as much as should be fed, and extreme care should be taken, not only that the grains are fresh and sweet, but that the receptacles for their storage and the boxes and mangers in which they are fed, should be kept scrupulously clean. Wet grains ferment very quickly, especially in warm weather. And if not stored in a tight receptacle, the liquid running from them not only produces a bad odor, but makes a breeding place for all manner of objectionable bacteria. Objections of this kind do not obtain where the kiln dried grains are fed, especially if they are dried before fermentation has set in.

TESTIMONY FROM INDIANA.

Every day the proof is growing stronger that HOARD'S DAIRYMAN was right when it said: "that success and good profit in dairy farming mainly depends on the man behind the cow." Some think it lies in the breed of cattle used, but that is only part of it. Others think it depends on the soil, or the location of markets, or many other things, all good in their place. But the fact still remains that with the best breeds of cattle, and on the best of soils and with excellent markets right at their door, there are plenty of men who do not make a success of dairy farming. *The man is not right.* If we were asked to describe the right sort of a man for this business, we would place first and foremost, that he should be a *teachable* man, a man who is hungry for sound knowledge and not so conceited in his own opinion, that he can not learn from others. It seems strange, but nevertheless it is true that there a great many men who cannot learn much of anything from what they read. They have never learned how. So, if they get a new idea, they must see it worked out. Some neighbor more enterprising than themselves must first demonstrate the thing for them. Of a different order of men is the writer of the following:

ED. HOARD'S DAIRYMAN:—I desire to say that HOARD'S DAIRYMAN is worth $1 each issue to me. I have gleaned what dairy knowledge I possess from it, and could not run my dairy successfully without it.

In two years time we have brought our herd up from an average production yearly of 180 pounds of butter per cow, to 310 pounds. HOARD'S DAIRYMAN showed us the way. Now we propose to build a silo and in another year we shall want a model barn.

We feel more than grateful to you for the great work you are doing, and know we voice the sentiments of thousands of farmers and dairymen.

Yours truly,
L. W. PAYNTER,
Campbellsbury, Ind.

EDUCATING THE PIG TO CLEANLINESS.

A private letter to the editor gives the following account of how German pigs are educated into cleanly habits:

"At Schladen I also saw a piggery where 400 head are brought from 40 to 200 pounds in four months. The small pigs are put into perfectly clean, cement floored, walled and ceiled pens, and the first thing is to educate them in cleanliness, which is done in the most simple manner, by merely placing a bit of fresh manure in a particular place, near the opening for removal. They are kept in a light litter of straw, and after four months are as clean as the day they were put in, without any cleaning."

The pig is naturally one of the cleanest of animals, although many farmers seem to think otherwise and act accordingly.

GROWING ALFALFA FOR SEED.

The following inquiry and answer on this subject—found in the *Breeder's Gazette*, will interest some of our alfalfa readers:

J. S. N., Lebanon, Ind., writes:

"I would like to know what crop of alfalfa makes the seed? I have been raising alfalfa for six years, but have never raised any seed, as I needed the hay and regarded the four crops of hay per year as worth more than the seed crop. This year I will not need four crops of hay from fifty acres of alfalfa, and I want to thresh a seed crop. I commenced cutting alfalfa June 11 and now, June 27, the second crop is about 15 inches high. I have 25 acres now in the barn and almost that much more to cut."

Kansas and Nebraska cut either the first or second crop for seed, preferring, I believe the second. It is cut when pods are about half colored, with a binder, but dropped off in bunches unbound. It cures in from one-half day to two days, is threshed in an alfalfa huller or clover huller, or even the ordinary threshing machine, although this does not get all the seed. Cost for threshing and cleaning is said to be about $1 per bushel. It yields from two to eight bushels per acre. The threshed straw is valuable for feed, although not as good as earlier cut hay. The seed crop, as with other plants, is said to be rather exhausting to the alfalfa.

CHAS. B. WING.
Champaign Co., Ohio.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Which Breed of Swine Most Prolific.

What breed of sows farrow the largest litters? We are of the opinion that the Chester White sows give larger litters than any other breed. Are we correct? Are there any conditions in breeding that govern large and small litters?
Waukesha, Wis. McM. BROS.

There are no statistics at hand that would justify the expression of any positive opinion as to which breed of swine is the most prolific, nor as to any conditions in breeding that govern large and small litters. Undoubtedly, proper care and feeding would have more or less influence in this respect. It has been noticed that swine fed for generations largely on corn and not given much exercise, incline to small litters, whereas, where there is a large variety of feed and a goodly proportion of protein, especially in the form of clover or alfalfa, for both males and females, there appears to be increasing fecundity.

Supplies for Babcock Test.

Are the Babcock testers as advertised in HOARD'S DAIRYMAN ready for use, and is all the material included for testing milk or cream? Will not cows vary in their test at different times of year on different feed? F. E. D.
Penn.

The Babcock tests advertised in this paper have all the appliances with them for making tests except that the purchaser must supply the sulphuric acid; but the test comes completely fitted with all the glassware necessary for its manipulation.

Cows will vary in tests, not only at different times of the year, but more or less, from day to day in the same week. The character of the feed does not make any appreciable difference in the test.

Cream Questions.

I am getting 32 quarts cream a day from my herd of cows, and use a U. S. separator. Cream is kept in a cool cellar about 60 degrees temperature. How long should I keep cream before churning? It varies from 4 to 6 lbs. butter to the 32 quarts of cream. It takes 1 hour to 1½ hours to churn. C. S. F.
Rouses Point, N. Y.

There is no specified time for the ripening of cream as it depends entirely on the temperature of the cream and its age. In creamery work the ripening is controlled by the temperature, and is so regulated that 24 hours are required to bring the cream to the proper ripeness. This is from 60° to 65° F., unless in very hot weather when it may be necessary to cool the cream below 60° F. to prevent too rapid ripening. The time required for churning, if the cream is properly ripened, would seem to indicate a thin cream, as is also shown by the yield. Cream containing 35% of fat, churns more easily and with less loss in the buttermilk than thin cream.

Only a Fair Yield.

I have a small dairy of grade Jerseys, (ten cows giving milk); during the month of June they gave 5971 lbs. of milk, testing 4.80% of butter fat. Does that show good results? They have good pasture and no grain. M. F.
Fair Haven, Vt.

These cows were averaging a trifle better than a pound of butter per day during the month of June. This must be considered a fair yield but in our judgment not hardly satisfactory to the modern dairyman. The presumption is that some of these cows are extra good ones and some of them decidedly inferior. We recommend M. F. to at once commence keeping a daily record of the milk yielded by each of his cows; have this milk tested from time to time and thus ascertain just what each cow is doing. Keep a regular book account with every cow, and if we are not greatly mistaken, he will find that some of his cows are considerably in debt to him, that they do not pay for board and care. Of course, such cows should be disposed of. There is no profit in keeping them and they should give place to better ones.

Silo on Low Ground.

Please advise me through colums of DAIRYMAN in regard to silo. I want to build one near barn; ground is lower where I want to build it and water settles into it. Would like to dig about four ft. into ground besides. Can grade around it so ground will be about level or sloping away from it. Would it be all right or ought it to have a drain leading from it or would it be better not to lower it into ground? Is 25 ft. deep enough to keep good ensilage? F. E. D.
E. Sharon, Pa.

We would not like to build a silo where water settles, and still more should we object going below the surface in such a place. Quite possibly, a silo might be built with a heavy grout bottom extending well under the wall and the outer surface of the wall thoroughly covered with cement, and in this way exclude water from coming into the silo; but our experience leads us to believe that it would be impracticable to exclude water by simply cementing the inside of the wall. It is very possible, of course, to let this silo extend four feet into the ground and build up the foundation with concrete, making a heavy concrete bottom and thus keep water out. There should be no drain from the bottom of a silo. As a rule, the material going into the silo should be sufficiently mature so that there should be no liquid at the bottom; but if there is, let it be there. The attempt to drain it off would be almost sure to admit more or less air and this would induce fermentation and decay.

Twenty-five feet depth makes a very satisfactory silo.

Does It Pay to Drive Cows a Half-Mile to Pasture.

Do you think it profitable to keep cows where you have to drive them ½ mile to pasture? If so would they not be better if kept in barn nights and fed some coarse fodder like green oats or corn fodder, or let out in small yard. F. L. D.
E. Sharon, Pa.

If cows are carefully driven, and not hurried or worried, a half mile to and from pasture ought not to interfere very materially with the yield of milk. We should much prefer not to drive them this distance twice a day, but should keep them in the barn or a small yard, nights, and let them have hay or green feed as might be most convenient and least expensive. A little hay is a decided advantage, even with good pasture.

Ice Water for Cows.

A Pennsylvania correspondent says he has to drive his cows about 100 rods to a creek and, in winter, the water is ice cold. His house and well (which is about 70 feet deep) are 200 feet from his barn, and he inquires whether he can put a tank in the attic over the kitchen stove for house purposes and let the surplus overrun through pipes to a tank in the barn, or whether he can pump directly from the well through pipes to the barn.

Most anything would be preferable to driving the cows this distance to the creek and letting them drink ice water, and some arrangements should be made for connecting the well with the barn. Of course, the connecting pipes should be put below frost, and we should prefer to have what is called a 3-way valve so that we could pump by windmill (or other power) to the house tank and the barn tank or directly above the well. One objection to pumping all the water first through the house is the constant, unnecessary noise of the water coming and going. With this 3-way valve, the simple turning of a rod directs the water just where one wants it. Keep the house tank well filled, but when full, turn the water off, and let it go to the barn or not pump at all. It is perhaps a little difficult to explain in words in a brief paragraph just how this is done, but almost any pump man will understand how to fix it so that it will work without any trouble. If the tank at the barn is in the open yard, by all means have a tank heater to warm the water when the cows want to drink. If the tank is located in the barn, especially if it is in the stable, the heat from the cows' bodies will keep the water fairly warm.

Getting Silage Out of a Pit Silo.

Will you kindly give an opinion as to the most efficient and economical method of getting ensilage out of a pit silo? W. N. B.
Fort Calhoun, Neb.

So much will depend upon the size and depth of the silo, and the amount of silage to be handled daily, that it is impracticable, without further information, to submit any serviceable suggestions.

As to Milk Coolers and Aerators.

J. J. G. of Spring Valley, Wisconsin, writes he is a young man and also young in the dairy business. He disposes of his milk at retail and has been thinking of getting a milk cooler and aerator. He asks us if we would advise him to do so, if the benefit would equal the expense.

So much depends upon circumstances that we hesitate to give specific advice in a case of this kind. When it comes to aerating, and cooling it at the same time, it is indispensable that this should be done in an atmosphere free from dust and odors. It is sometimes pretty difficult, if not impossible, to obtain such a place, and then it is much better to expose the milk as little as possible. If one does not have considerable milk to handle, the milk can be cooled and aerated to very good advantage by setting a common deep pail in cold water and dipping up and pouring back the milk for a little while. It there is much milk to be cooled, of course, one of the aerating coolers is desirable.

Alfalfa With the Yellows.

What can be done for an alfalfa field, sown this season in May, that looks yellow at the root? What was the cause of the young plants showing this from the first? The plants did not thicken up and grass has grown in a mat over the field. Will it come out right next year? Your correspondents speak of the owners of farms for rent, not taking an interest in having things handy for tenant. I want silo and up-to date conveniences, but my tenants neither use nor care for these things, with a 28 cow dairy. Here is an opening for an up-to-date tenant with a subscription to HOARD'S DAIRYMAN thrown in and recommendation to follow in the light of progressive dairymen. X. X.
Mich.

The lower leaves of the alfalfa plant, especially in wet seasons like the present are very apt to show the effect of the yellows. The cause is not known, but the best remedy is to cut the alfalfa at once.

Unless there are sufficient young plants under the grass to make a strong growth in the spring, which can only be told by examination, it will be necessary to turn the surface under deeply with a plow and reseed in the spring with a nurse crop.

Will a Shredder Pay?

In your issue of 10th inst., page 505, you quote from *Breeder's Gazette* a statement of James A. Parden that a ton of fodder will be produced in a cornfield with every 40 bushels or 2,800 lbs. corn. I am in the act of purchasing a harvester and a shredder, but I am greatly discouraged by this report. Forty bushels to the acre is a good yield of corn here; therefore we will hardly ever exceed a ton of dry stuff per acre if Mr. Parden is correct. Can you put me in touch with any farmers, who can give a more encouraging report of the tonnage of stover per acre. W. L.
Fort Smith, Ark.

The figures given by Mr. Parden in the extract published are probably very conservative. Prof. Henry in his work on "Feeds and Feeding" quotes from a report of the Pennsylvania Experiment station the yields of ears and stover from experiment stations in New Jersey, Connecticut, Wisconsin and Pennsylvania, showing an average of 4,415 pounds of ears, 3,888 pounds of stover. At this rate, an acre of corn yielding 2,800 lbs. of ears should yield 2,420 pounds of stover. It would seem that this is well worth preserving, but whether it would pay to invest in the shredder would depend very largely upon the necessity for being extra careful with roughage. If there is an abundance of hay, it would probably not pay to shred these stalks; otherwise, and especially where hay is dear, it would pay, and pay well. All the experiments so far tried go to show that fully one-third of the feeding value of the crop of corn is in the stover. Certainly, this is enough to lead a careful man to take extra pains to preserve it, and if he has not stock enough to eat it, it would be good policy to put more stock on the farm and not allow this valuable product to go to waste.

United States Government Whitewash.

I think that some time ago you published the formula which the United States Government used in preparing whitewash, but I fail to find it among the copies I have saved of your paper. Will you kindly publish it again? B. C. T.
Boonville, N. Y.

Take half a bushel of unslaked lime, slake it with boiling water, cover during the process to keep in steam, strain the liquor through a fine sieve or strainer and add to it a peck of salt previously dissolved in warm water, three pints of ground rice boiled to a thin paste and stir in while hot. Then add half a pound of Spanish whiting and one pound of glue previously soaked in cold water and then heated in a small pot hung in a larger one filled with water. Add five gallons of hot water to the mixture, stir well and let it stand a few days, covered as nearly air tight as possible. It can be colored by adding ochre, lamp-black, ground keel or bluing to suit. It should be applied hot, for which purpose it can be kept on a portable furnace.

Handling Clover for Seed.

Will you kindly inform me through the columns of your paper how to handle clover for seed in proper manner, as I have 12 acres of very promising clover going to seed and do not know much about the proper handling of it. T. J. R.
Clyde, Mo.

Only the second crop of clover is saved for seed, as the first crop usually comes on too early for the bumble bees to get in their work of pollenizing the flowers. Let the clover get good and ripe, mow it with an ordinary mower, let it lie on the ground for sometime, and when thoroughly dry on the ground, rake into windrows and after sometime there, if not wet with rain, haul to stack. Give the stack a good topping out with coarse grass or straw to shed the rain and thresh in the cold, clear days. Clover does not thresh well unless very dry. Damp days interfere very much with threshing. Clover does not shell readily, and hence it may be exposed in the field much longer than the ordinary grain crops.

Does it Pay to Thresh Oats?

Have ten acres of oats; which would be the more profitable, to have them threshed and ground into mill feed, or to rick them and this fall after I fill my silo, to have them run through the cutter. Think I can have them run through the cutter cheaper than I can get them threshed. Want the feed for cows. The mice never bother sheaf oats, which have been run through the cutter as they cannot make holes through it.
New Vienna, O. J. A. S.

Persons who have tried the plan of caring for oats as proposed by J. A. S. are enthusiastic in its support, claiming that it is not only a much cheaper way to handle the crop, but far more effective. The editors of this paper have never tried it, as they raise only oats enough to feed their horses and are beginning to think that even this does not pay.

Ashes and Lime for Alfalfa.

I am thinking of sowing five acres of alfalfa on gravelly ground. Would it do to use manure and ashes together? The land has some sorrel in it. Or would it be better to use lime in connection with manure? There is none raised in this section, so any suggestion would come good.
Mt. Vernon, N. Y. C. E. L.

The combination of ashes with stable manure would be all right, as the ashes would supply both lime and potash. We should prefer, however, not to apply them combined, but each separately. Also, if there is not now a fair supply of lime in the soil, add some lime to the ashes. The presence of sorrel may indicate a deficiency in lime.

New York Dairy Statistics.

A circular from the New York Department of Agriculture gives the following information on this subject:

The enforcement of the milk law is one attended with as many, if not more difficulties as any other with which this department is charged, on account of the volume of milk that has to be guarded, New York city last year taking for consumption over fourteen million forty-quart cans. The population of New York city being approximately three-sevenths of that of the state and assuming that people elsewhere consume practically the same amount of milk per capita, it would make the milk consumption of the state of New York practically thirty-three million forty-quart cans, to say nothing of the amount of milk delivered to butter and cheese factories for manufacture into butter and cheese. There are in the state of New York about sixteen hundred of such factories in which during the year 1900 there were made 126,658,672 pounds of cheese, and 39,183,311 pounds of butter. Estimating this butter and cheese in their equivalents in milk, and we would have the 39,183,311 pounds of butter manufactured approximately from 11,700,000 forty-quart cans of milk, and the 126,658,672 pounds of cheese manufactured approximately from 15,750,000 forty-quart cans of milk, making a total of 60,450,000 forty-quart cans of milk, the purity of which the agricultural law is to guard.

The butter and cheese manufactured in the State of New York for the year 1902 was as follows:

New York has 61 counties; dairy establishments are operated in 52 of them.

	No. of factories.	*Lbs. of butter.*	*Lbs. of cheese.*
Butter factories,.....	448	50,060,954	
Cheese factories.....	1,010		89,982,002
Factories making both butter and cheese.....	193	5,117,251	29,307,711
Milk stations.....	539	4,646,561	4,568,303
Condensaries..... ..	18	95,504	639,280
Total....	2,208	59,920,270	124,597,296

Increased number of pounds of butter over 1900..... 20,736,959
Decreased number of pounds of cheese as compared with 1900..... . 2,061,376

The United States Census of 1900 shows that the total number of pounds of cheese made in the United States was 298,344,654, and that 130,010,584 pounds were made in New York State. From these figures it would indicate that New York State made approximately one-half of the cheese made in the United States.

Dairy Sense and Purpose in Kansas.

ED. HOARD'S DAIRYMAN:—I would like to ask you some advice along the line of dairy work. I am the owner of something like seventeen hundred acres of land; in one farm I have 600 acres, I

THE U. S EXCELS ON ANY TEMPERATURE.

Our "would-be competitors" the DeLaval Separator Co., finding themselves badly beaten in the six weeks' tests of six different makes of Separators at the Kansas Agricultural College, as shown by the official Bulletin No. 123 issued May 26, 1903, in their efforts to break the force of so disastrous a defeat, have compiled a Bulletin of their own "getting up" purporting to be signed by several students, in which they try to make it appear that the DeLaval was not terribly beaten, as the Official Bulletin shows it was as follows:

Average test of skimmilk of DeLaval Separator .048
" " " U. S. " .033
U. S. excels DeLaval .015

Showing that the DeLaval Separator left 45 per cent. more butter fat in the skimmed milk than the United States.

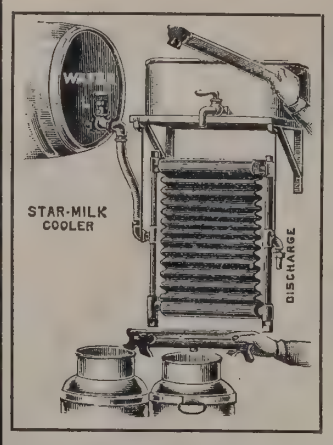
Again in this "gotten up" Bulletin, our "would-be competitors" state that the U. S. Separator "choked up" on 39 lbs. of milk at 70 degrees of temperature and that the DeLaval ran 80 lbs. Every dairyman using a U. S. Separator knows that the U. S. will not "choke up" on 80 lbs. of good milk at 70 degrees, and that such statements are made in an attempt to break the rapidly gaining popularity of the

U. S. SEPARATOR.

We make the following proposition to any dairyman wishing to buy a separator, viz.: We will put a U. S. Separator into his dairy and agree that it will not "choke up" on 80 lbs. or twice 80 lbs. of milk in good condition at 70 degrees, provided he will pay for the separator if it does not "choke up."

The best authorities do not advocate separating at 70 degrees, but if Dairymen prefer to, the U. S. will do it when properly adjusted.

The U. S. Separator skims cleaner than any other separator on the market at any temperature from 70 degrees to 156 degrees at proper adjustment. The Official Bulletin No. 123 of Kansas Agricultural College, dated May 26, 1903, states that



The U. S. Excelled all Others in tests of Skimmed Milk and in Minimum Total Loss.

THE U. S. SEPARATOR HOLDS WORLD'S RECORD.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

WHEN YOU SEND IN YOUR RENEWAL, SPEAK TO A FEW OF YOUR NEIGHBORS AND HAVE THEM JOIN YOU. CLUB RATES: 2 Subscriptions, $1.50; 3 Subscriptions, $2.00; 4 Subscriptions, $2.50; 5 Subscriptions, $3.00.

at the farm. The **CHAMPION** is simple, cheap, effective—it is the best there is. Our Booklet about it for the asking.

Champion Milk Cooler Co.,
67 Main Street, CORTLAND, N. Y.

would call it a very good stock farm, with plenty of good water and shade and also plenty of good land to farm, to raise all the feed needed on the farm. About 400 acres of this land is now in grass, some Kentucky blue grass, some clover and timothy and English blue grass, the rest in farm crops, corn, oats and other crops. Now, in another farm, I have 500 acres, very much the same kind of land and adapted especially for stock. The man that lives on this farm is thinking of trying a dairy herd; he now has high grade Short-horns, and some registered. We are three miles from a little town in which is a creamery owned by a syndicate. You will see that we could pasture quite a large number of head of cattle, on this farm. Now the price of butter fat is quite an object. I don't think the creamery will pay very good prices compared to what a city would.

This farm lies about 40 miles from Kansas City, Mo., on the line of the Santa Fe R. R., with good train service. First we have the pasture, the the shade and plenty of good water, land to grow all the feed to feed the stock and a large amount of pasture, Taking all this into consideration together with the raising of calves, stocking up the farm, I would like your best judgment as to the kind of a cow to start with. Would it be best to try the double-purpose cow, or take the straight dairy cow, such as the Jersey, Guernsey or Holstein? I see that each has some advantage. If one could get a good line of Short-horn cows that was good milkers, it might be that they would do well, taking into account the raising of the calves for beef, on the farm, then with some of the other breeds of dairy cattle. One is much surer to get good milking heifers in their herd than they would with more beefy inclined cattle. I am very anxious to get started right (By the way this man has been in the business heretofore and has had some little experience. The reason he changed his line of work was on account of help.) I have never been favorable to dairy bred stock, but it may be on account of not knowing their value for dairying. I think we would have our own separator and only sell the butter fat, retaining the milk for the feeding of calves, pigs, and use on the farm.

Under these conditions what kind of a cow would you recommend, as a profitable investment? I should like very much to have your opinion. If we were on a very small tract of land, I would not have much trouble about the kind of a cow, as it would be either the Jersey or Guernseys, but with the large tract of land it is a question. M. G. MILLER.

Olathe, Kansas.

We have never been able to see why first-class dairy ideas, first-class dairy cows, and all that means in modern good dairy sense, should not prove just as profitable in Kansas or any of the western states as they do in Wisconsin. There has been, as we view it, a great deal of foolish talk to the effect that the Kansas, or Nebraska, or Iowa dairy farmer could not afford to use specially bred dairy cattle because he has so much coarse forage to feed. As though this feed will not make its equivalent in milk and butter just as profitably as it will in beef!

If a Kansas man has a good creamery near at hand that will pay him what his butter fat is worth, there is no reason on earth why he should not make a first-class dairyman of himself and use first-class dairy cows, and dairy ideas.

If our correspondent desires to go ahead with the dairy idea, work it out for what it is really and practically worth, our advice would be first, to organize the farm for first-class dairy work, put up good barns and stables, built warm and *abundantly* lighted, and ventilated on the King system. If he can get good Short-horn cows of dairy form, which will hold out in their milking season 10 months, commence with them, but at the head of the herd place a *thoroughly* good Guernsey, Jersey, or Holstein bull, as his taste inclines. Select the best heifer calves from those mothers of the most pronounced dairy form. There will be less of the beefy tendency in them to overcome. Breed them back to their father when 15 months old. Hold steadily in the line of the breed you start with. Change bulls for another of same breed when it comes to breeding the granddaughters of the first sire. Cull out and sell for beef at what price you can get, all the unprofitable cows when they prove by their second season in milk that they will not produce 250 to 300 lbs. of butter a year. Keep right along on this line and our word for it, a first-class dairy farm in Kansas, run for the specific purpose of dairy results, will pay as well as it will in Wisconsin.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

A Profitable Dairy Farm.

$50 per head for Keeping Cows. $100 per Head in Gross Receipts.

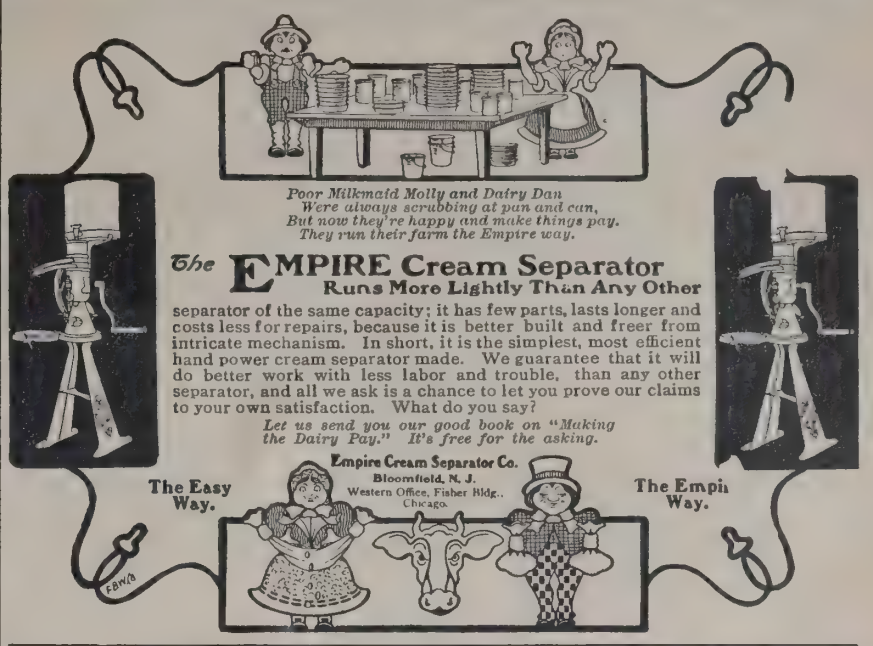
Twenty-five cows maintained on ten acres of land.

Fifty dollars a head per year for maintenance.

One hundred dollars a year in receipts from each cow.

This is a record made by A. A. Wright, M. P. for South Renfrew, on one of the smallest dairy farms in the province.

"It is true," said Mr. Wright, when asked for the details behind the brief statement just given, "that I do not produce on the ten acres all the feed required for the twenty-five head which I keep. I rent about three acres of pasture land, but this is for the purpose of giving the cows exercise rather than for the amount of feed they obtain from the rented land. I also buy my hay, but it is cheaper to buy hay than produce it. Of course I buy my bran also, but this is done by all dairy farmers, no matter how much their holdings. The land which I own is mainly given to the production of corn and silage. I plant Longfellow and Leaming, and raise about 15 tons to the acre. The cost of maintaining my cows will vary from year to year, depending largely on the price of bran. Some years bran will cost $18 a ton, and in other years I can buy as low as $12. Taking the average of one year with another, however, the cost of feeding per head runs at about $50 and the average returns per cow will be $100 per year. The milk is sold in town at five cents a quart in summer and six cents in winter. I have three men at work all the time. My cows are all Jerseys. One of them gave 8,118 pounds of milk in a year, testing 4.2 per cent, but I unfortunately lost her with milk fever last year.



Nearly all of my cows, however, run six to eight thousand pounds per year, and none test under 4 per cent. I know just what each cow is giving, because I weigh the milk night and morning, and know at the end of a month how each cow in the dairy barn stands."

Mr. Wright was the chief promoter of the creamery located in the town of Renfrew, a creamery which has a capacity of a car of butter daily, and is making at the present time three to four thousand pounds per day. "That creamery," said Mr. Wright, "has been one of the most valuable institutions ever started in our part of the province. It has been running eight years now. Patrons are, at the present time, netting about 90 cents per 100 pounds for milk, which is fully double what they received before the creamery started. The largest patron will draw $2,000 a year, and the average receipt per patron will run about $100.

Hog production is an important side-line with our dairymen. One of the patrons of the Renfrew creamery, David Barr, Jr., will have as many as 10 hogs in his stable at a time.

"Our farmers are engaged both in dairying and beef production, but they do not as a rule use the same animal for both purposes. Those who make dairying their chief business, and who wish to turn off some fat cattle during the season, will buy beef calves from neighbors who are engaged mainly in dairying. Practically all the sires are pure-bred, of one type or another. The co-operative auction sales for the disposal of pure-bred animals have helped very materially in improving the class of stock in our section. Our county council has assisted these auction sales by giving grants to assist in meeting expenses.

"Partly as a result of dairying, but mainly owing to the industry and thrift of our people, farmers in South Renfrew are in an excellent position financially. It is a rare thing to find a man with a mortgage on his place, and there are plenty of farmers who are worth twenty-five to thirty thousand dollars."—*Sun.*

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Buttermilk vs. Skim Milk for Hogs.

ED. HOARD'S DAIRYMAN:—Which is the most valuable feed for hogs, buttermilk, or skim milk fresh from separator? Also which stock of hogs will pay best, fed on milk? J. M. K.

Ducktown, Tenn.

The two milks are about equal in value. There is but little difference in the various improved breed of hogs so far as the result in feeding skim milk is concerned. But if you wish to get the largest returns from your milk, with any breed, feed it to young pigs of 25 to 125 lbs. weight, and feed with it middlings, corn meal, or boiled potatoes. With young pigs add a tablespoonful of blood meal daily for each pig.

Farmers' National Congress Program.

The following is the program of the Farmers' National Congress to be held at Niagara Falls, September 22, 1903.

1. Address of Welcome, Gov. B. B. Odell, Jr., New York.

The Price of Milk in New York.

ED. HOARD'S DAIRYMAN:—Your last week's DAIRYMAN has an article from he *N. Y. Farmer*; they may reason as they have a mind to, but you certainly know better than to print it without a note from your able pen, as it is out of all reason for a creamery to pay such prices as quoted in this article (excepting a dairy here and there, we have one or two dairies that can and do compete net to the patron Borden prices.) We are in the 29th zone. *N. Y. Farmer* says Borden price $1.60 per 100 lbs. milk; creamery returns $1.60 and patron has skim milk, 15 cents, which equals $1.75. Profs. Farrington & Woll tell us that 100 lbs. of milk testing 4 9-10 will yield 5½ lbs. finished butter, this must sell for 29c, which equals $1.59½ net. Now, the creamery must be paid for making, etc., and that is generally 3c; therefore to net the farmer $1.60 the butter should be 32c per lb., and that on a 4 9-10 test, which is a test far beyond the average dairies of patrons to a creamery. F. B.

Mongaup Valley, N. Y.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The Quotation Committee decided on 18½c steady as the official price.

One hundred and fifteen tubs were offered by Moles and sold to Sherwin at 19 cents per pound.

Former Markets	*Sold*	*Official Price*
July 20, 1903	0	20
July 21, 1902	0	21
July 22, 1901	40	20
July 23, 1900	145	19
July 17, 1899	96	18

The output for this district is 806,400 lbs.; New York market steady; receipts, 13,897 tubs.

At the session of the board, one year ago to-day, 491 tubs were offered and 96 tubs sold at 17c. The Quotation Committee on that date reported the official market steady at 18 cents. H. C. B.

Elgin, Ill., July 27, 1903.

CONCERNING OUR ADVERTISERS.

TOPPING THE MARKET.

Cattle fed on shredded corn stover have repeatedly topped the live stock market in price. The great nutritive properties of shredded corn stover make it an ideal stock food, easily accessible to all farmers. The size and price of huskers and shredders, until recently, made it impossible for the small grower to secure a machine for the preparation of corn fodder. The advent of the Deering Two-Roll Husker and Shredder, which meets the wants of the individual farmer, placed it within the means of the small grower to enjoy all the benefits of shredded corn stover. The Deering Four-Roll Husker and Shredder is a strong, reliable machine designed especially for the large grower or a club of farmers. The scientific construction of the Deering shredder head makes the shredded stover produced by Deering machines especially wholesome and nutritious. Deering shredded corn stover is famous for its quality. It makes fat cattle.

Absolutely perfect. Soon pays the cost Cheapest because best.

Water always fresh. Send for catalogue No disease where used.

Water In The Stable a Necessity.

It is universally acknowledged that stock in the stable should have constant access to water of suitable temperature, and all progressive Dairymen are putting in some form of Watering Device. Why not use the Best? Write for descriptive circular.

C. E. BUCKLEY & CO., Poughkeepsie, N. Y.

AS USUAL IN SCORING CONTESTS

WORCESTER SALT WINS

A six months' scoring contest recently concluded in Michigan, under the auspices of the State Agricultural College, was won by the Lotus Creamery Co. of Vicksburg, whose letter we quote:

"VICKSBURG, MICH., 6-1-03.

"WORCESTER SALT CO., NEW YORK.

"DEAR SIR: We are very much pleased over the idea that our buttermaker stands at the head in Michigan.

"We used Worcester Salt in the butter scored in the contest and are so well pleased with its qualities that no other salt stands a show with us.

"Mr. Stafford claims that the ease with which it dissolves, and its even strength and purity, make a vast improvement over other salts tried in rendering a good butter flavor.

[SIGNED] "Yours truly, O. O. BISHOP, Secretary."

Mr. Stafford is added to the long list of buttermakers who know

IT TAKES THE TO MAKE THE **BEST**

WORCESTER SALT COMPANY

168 DUANE STREET, NEW YORK.

Grit

Grit is a good thing in its place, but a bad thing in butter. Gritty salt—salt that's icy, insoluble, full of lime, chlorides and magnesium, is accountable for many exasperating difficulties of dairymen. It represents a loss of time, labor, money and patience, not always attributed to it. With DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—your butter difficulties will disappear, and a gain in time, *money* and less labor result. Its dry, pure flakes dissolve quickly, imparting a rich flavor and keeping quality that find ready favor and highest market prices. "Just Salt" is a valuable booklet every dairyman should read. We send it free.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

CANTON, N. Y., July 25—Cheese — Offered 2,510 boxes of Twin cheese and 1,400 tubs of butter. Cheese sold at 9½c; butter at 20c.

WATERTOWN, N. Y., July 25—Cheese—Sales 7,000; 9⅛@9⅜c for large; 9⅝ @⅞ for small.

NEW YORK, July 27.—Cheese Receipts 7,996 pkgs: market steady to firm; small white and colored 10¼c; large colored, 10c; large white, 9⅞c

Butter—Receipts 13,897 pkgs; market steady at decline: state dairy 14@17½c; creamery extra, 19c; renovated, 14@17c; creamery, common to choice, 15@18½c; factory, 12@15c; imitation creamery, 15@17c.

Eggs—Receipts 8,494 pkgs; market firm; state and Pennsylvania first 15@18c; western extras, 19c; state and Pennsylvania, extras 19@20c; seconds to firsts.14@18c.

BALTIMORE MARKET.

BALTIMORE, Md., July 23—Butter—Owing to the ideal weather for butter making for the past week or ten days, the receipts since our last report have been liberal, while the market for the past week has ruled steady on all choice to fancy offerings; there is not that activity that characterized the market some few days since: the principal outlet just now is for local consumption, and as a rule the buyers discriminate very closely as regards quality; this week so far there have been but few speculators on the market, and what few that are, are in search of long lines, and nothing below the grade of firsts will command any attention at all, hence there is quite an accumulation of the under grades. Good to choice imitations are in moderate supply and good request. Ladles—The supply is fully equal to the requirements. Packing stock- All fresh and sweet arrivals are meeting fair sale, while poor cheesy stock is hard to sell. Prints and blocks—The supply is ample for present demands. The butter market at the close is quiet and barely steady.

Creamery Separator, extras, 21c; firsts, 20@20½c; seconds, 17@19c. Imitation Creamery, extras, 19c; firsts, 18@18½c; seconds, 16@17c. Ohio & Indiana Ladle, extras, 17c; firsts, 16c; second 13@15c. Creamery blocks (2-lb.) extras, 22c; firsts, 21c; seconds, 19@20c; Creamery prints (¼ lb) extras, 23c; firsts, 21@22c; seconds, 19@20c. Md. Va., & Penna. Prints, extras, 21c; firsts, 20c; seconds, 18@19c.

Cheese—The receipts are ample; demand irregular; market quiet and unsettled. Swiss—Our quotation are for new now, as the old stock is pretty well exhausted.

N. Y. State—Cheddars, fine, 10½@10¾c; choice, 10@10¼c; fair, 8¾@9¼c, Flats, fine, 10¼@10¾c; choice, 10@10¼c; fair, 9@9½c; Small, fine, 10¾@11c; choice, 10@10½c: fair, 9¼@9¾c; Ohio Flats, fine, 9@9½c; choice, 8@8½c; fair, 7@7½c; O. Picnic, fine, 9@9½c; choice, 8½@9¼c; fair, 7½@8c; Swiss Cheese, (domestic) fine, 13@13½c; choice, 11@12c; fair, 9@10c.

Eggs—The receipts of strictly fresh eggs are very light, and for this kind the demand exceeds the supply, while the receipts of so-called fresh are fully equal the requirements, as a few of this kind will go a long ways. Eggs should be closely candled at the starting point; by adopting this method, you will avoid a heavy loss at this end of the line. The market is firm and quite active for all choice offerings at 17½c.

301 Exchange Place. G. M. LAMB & BRO.

NEW YORK MARKET.

NEW YORK, July 25.—Butter— Receipts for the week, 67,099 packages. Exports for the week, 30 packages.

Creamery, extra, 19½c; medium, 18@19c; poor, 15@17c; Dairy, extra, 19c; medium, 16@18c; poor, 14@15c.

Cheese—Receipts for the week, 38,246 boxes. Exports, 2,503 boxes

Conditions about the same as last week; sales in the interior of this state, are fully up to quotations here, and most of the small cheese went into cold storage Export trade was light owing to the limited supply of large cheese. Skims, if very fine, sell readily, while all other grades hang and are lower in prices. We quote:

Full Cream, extra, @10½; medium, 10@10¼; poor, 7@9c;

Eggs—Receipts for the week, 53,610 cases.

Strong steady demand for strictly fresh stock caused a scarcity, and holders were obliged to take some of their April storage goods to fill shortage. Poor to fair stock, however, is very plentiful, and buyers make the price. We quote:

New York & Penn., strictly fresh, per dozen, 20@21c; Northern & Western, strictly fresh, 19@20c: all Sections, poor to good, 12@18c.

The Art of Milking.

(Continued from page 567)

consin, three cows were milked during a week by one person A; the following by another person, B. From the milk A received during this week 11.8 kilograms butter was churned, while from the milk B got only 9.8 kilograms butter was produced, a difference thus of 2 kilograms.

This result is not only owing to the greater quantity of milk received, but, more still, to the fact that the last drawn milk is by far the richest. That this is the case anybody might easily ascertain for himself by pouring the very first and the very last drops of milk from the same teat into cream tubes. When comparing the tubes after the cream has risen, he will be surprised at the great difference in the thickness of the layers of cream; the milk first drawn looks, judging from the layer of cream, like good skimmed milk, the last milk drawn is more like thin cream. Through an experiment tried at an agricultural school in Denmark, it was found that the first streams of milk contained only 0.6 per cent fat, while the last strippings of milk from the same cow contained as much as 10.2 per cent of fat.

A thoroughly clean milking, therefore, is very important, not only as a means of developing the milking power of the cow, but also to produce richer milk. And the milker who does not give himself time thoroughly to milk the cow clean, either does not understand his duty or does not care to carry out his work conscientiously. It is important also how often the cow is milked daily. Some experiments concerning this question have also been tried, which show that the more times a day the cow is milked the more and the richer the milk she yields.

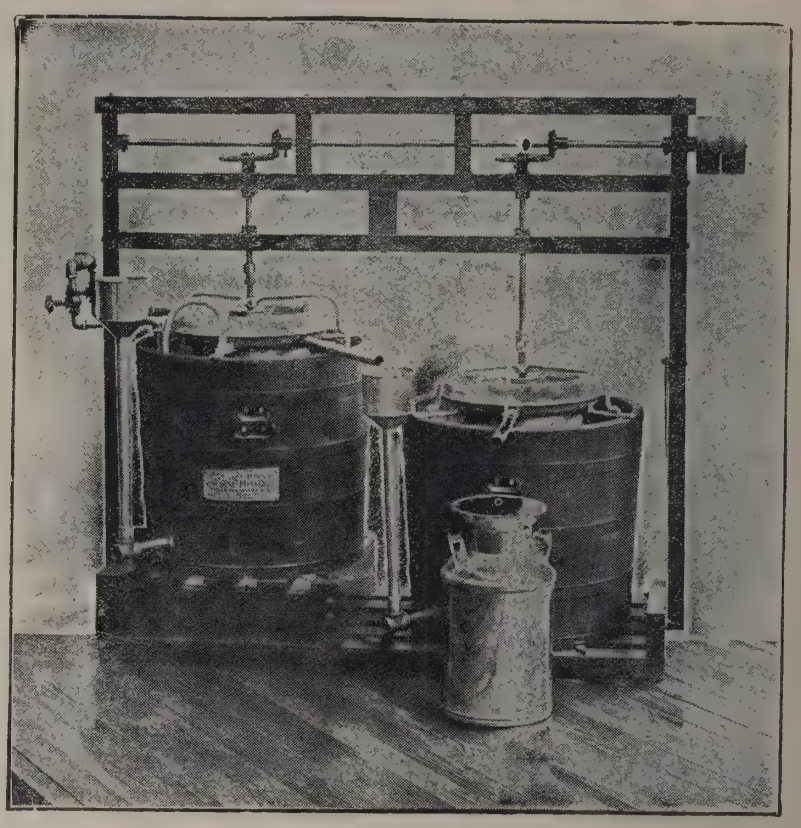
GUERNSEY BULL, HOMESTEAD'S GOLDEN DUKE, A. G. C. C., 6906.
Property of L. V. AXTELL, Perry, Ohio.

But whether one milks three times or only twice a day, the intervals between the milkings must, as far as possible, be of the same length. The cow is in a very high degree dependent on habit, and her udder works even and regularly. The milking hours, therefore, must be carefully observed, and the same persons must every time, in the same course, milk the same animal. If the milking is begun too late, the cow becomes uneasy, and the tension of the udder causes pain to the animal—in both cases loss of milk ensues. The fact that the quantity of milk is lessened by milking less frequently and less energetically is a thing of which one avails one's self when wanting to dry a cow. But even in this case it is a bad plan to clean strip the udder; it is by far preferable to milk less often, finally only once every other day, every third day, or more seldom still, till the cow gives so little milk that the milking might be dispensed with altogether. During the biestings period it must be considered not only wrong, but even dangerous often, and hard to milk such cows which show any disposition for milk fever. According to examinations made by a famous Danish veterinary surgeon, this disease is caused by an increased activity in the udder, which must be considered still further increased by energetic milking. But for these two periods, when the cow is being dried and when she gives biestings (first milk), she can scarcely be milked too hard (that is too often and too energetically).

The milker must pay great attention to the cleanly condition of the udder and the teats. If he observes knots or tenderness in the udder, sores on the teats, the milk-canal stopped up, or the milk having an unnatural appearance, etc., he must at once tell the foreman. Disease in udders and teats often being contagious, cows in that way infected must always be milked the last, and the milk from the affected part of the udder be put into a special vessel and destroyed, in order to hinder further spreading of the infection. The milk-canal in the teat is sometimes very tight (the cow being what is called hard-milked) or often shows an inclination to get stopped up.

To use a straw, or such like, to widen and "cleanse" the canal is very bad policy, because in that way inflammation of the corresponding part of the udder might easily follow. A teat which has a stopped milk-canal must first carefully be worked or kneaded between the palms of the hands, and then carefully milked clean. A heifer is often sensitive for the milking manipulation, and this sensitiveness will sometimes last until she gets older; in this case the milker must be still more kind and careful at the milking; and means of restraint or force must be used only in case of great necessity.

Worms in Horses.



ED. HOARD'S DAIRYMAN:—Frequent inquiries are made as to the proper remedies for worms in horses, especially at this season of the year, when some of the internal parasites quit their hold, and are expelled from the intestinal canal, and thus brought to the notice of the attendant. Under any circumstances the discovery of a few worms naturally suggests the presence of others; but in the event of the horse from which the parasites have been expelled being in poor condition, or suffering from a cough or any common disorder, the worms are quite certain to be selected as the cause of the derangement, rightly in some instances, but more often without reason.

Parasitism is the normal condition of things in the natural world—utterly inexplicable, but, as to its realities intelligible enough. To abandon all forms of independent life, and attach itself to a higher organism for the sake of securing an easy subsistence is the part which the parasite has to play, and in fulfilling its destiny, it is not necessarily obnoxious to its host. Often, indeed, its presence is unsuspected, but in certain cases, the organs that are invaded, are of vital consequence—for example, the brain, lungs, liver and heart; and when, in the unconscious pursuit of its own object in supporting its own life, and perpetuating its species, the parasite penetrates the structures of these organs, the result is necessarily disaster.

Horses are liable to play the part of hosts to a somewhat numerous family of internal parasites, including both the flat and round worms. Of the first named, flat or tape worms, there are three varieties, all of which are interesting to the student, but have no significance as causes of disease. All of them are remarkable for shortness as compared with their breadth, all are unprovided with the usual tape worm hooks, and in the case of each variety, there is an uncompleted history to be worked out. Most of the specimens of the tape worm family have a recognized larval stage in the organism of one of the higher animals, but the larval stage of the three tape worms of the horse is entirely unknown. The other family of parasitic flat worms (flukes) infest the liver of the horse under exceptional conditions.

When horses, especially colts, are pas-

A GREAT SUCCESS.

The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

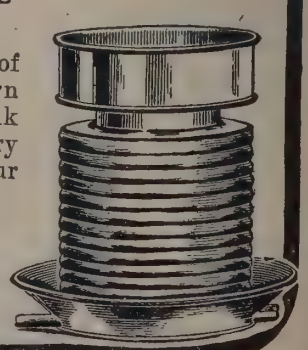
BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the **Buhl Factory, "Improved Elgin" and Genuine Iowa Cans**; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.



Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

tured on rotting lands they take up the larvæ of the fluke, as do sheep and cattle, but unless a considerable number are swallowed, or the animals are in weak health, no serious effects follow. The cases of colts dying of a disease in all respects like fluke rot of the sheep have been recorded in some of the great rot years; but as a rule, horses and cattle, although they are not exempt from the invasion of the fluke, do not suffer in consequence to anything like the extent sheep do.

Round worms are well represented in the intestines and stomach of the horse. The different bots inhabit the stomach as temporary parasites, while undergoing the development necessary to fit them for an independent life, when they attain the perfect insect state, and it is certainly true of them, that they generally pass the few months of their captivity without making their intrusion felt, or indeed, known, until they begin to quit their habitation for the outer world, which they will soon inhabit as perfect insects. Cases of perforation of the stomach by bots have been reported from time to time; but under ordinary conditions, bots do not cause any injury, beyong the loss of the fluids which they consume, and it is certain that they are found hanging in clusters from the interior of the stomach in perfectly healthy horses. In the beginning of summer the larvæ quit their hold of the mucous membrane to which they attach themselves, and are expelled. When they are seen in the dung, it is often considered desirable to give some sort of worm powders, and as the bots come away day by day, as they do when their time arrives to seek a new habitat, the remedy obtains the credit of effecting what is a perfectly natural process.

Premature expulsion of bots cannot be secured, as no medicine has been found, which will compel them to quit their hold.

A very large round worm infests the intestines, sometimes in enormous numbers, occasioning some irritation and perhaps diarrhœa. Attacks of colic are sometimes attributed to the presence of this worm, and it is easy to understand how their movements in the intestines may cause spasmodic contraction of the muscular coats of the canal, attended with pain. More serious are the effects caused by two vareities of strangles. The adult worms, which vary from one to two inches in length, bury their eggs in the mucous membrane, and the young worms form small red nodules in the cæcum and parts of the colon. Emerging from these nests, some of the young worms enter blood vessels and cause aneurism in different arteries.

Others remain in the intestinal canal and excite inflammation, which in many cases has ended fatally, in colts particularly. The intestines of horses also harbor another round worm, which is known as the whip worm, from the long lash like appendage which extends from the body. This structure is really the neck of the worm, although it is not unnaturally looked upon by the ordinary observer as the tail, which it certainly most resembles. This worm infests the terminal part of the intestinal canal, and lays its eggs on the exterior of the gut, where they may be seen as a yellow powder round the anus on horses which are infested by the worms.

Medicines for the expulsion of the round worms are numerous enough; turpentine is a favorite remedy in doses of one-half oz. to one oz., mixed with four to eight times the quantity of linseed oil. An old-fashioned system of treatment by mercury and antimony was at one time popular, and fairly successful when it was properly carried out. A ball containing half a drachm of calomel and the same quantity of tartrate of antimony was given every morning for three to six days, and was immediately followed by four or five drachms of aloes. But the most easily applied and simple plan of treatment is, 15 grains of santonin in a ball, with 3 drams of aloes, this dose to be repeated in four or five days. Treatment of tapeworm need not be considered so far as the horse is concerned, as the varieties of that worm which infest the animal are apparently not injurious, and, further, do not give any indications of their presence. W. R. GILBERT.

Montreal, Can.

Buff Jersey on Skim Milk.

ED. HOARD'S DAIRYMAN:—I am in receipt of many letters thanking me for the helps my articles in HOARD'S DAIRYMAN are giving to its readers. This is very pleasing to me as I am anxious to assist in any way possible. I take the liberty of giving in full a sample letter:

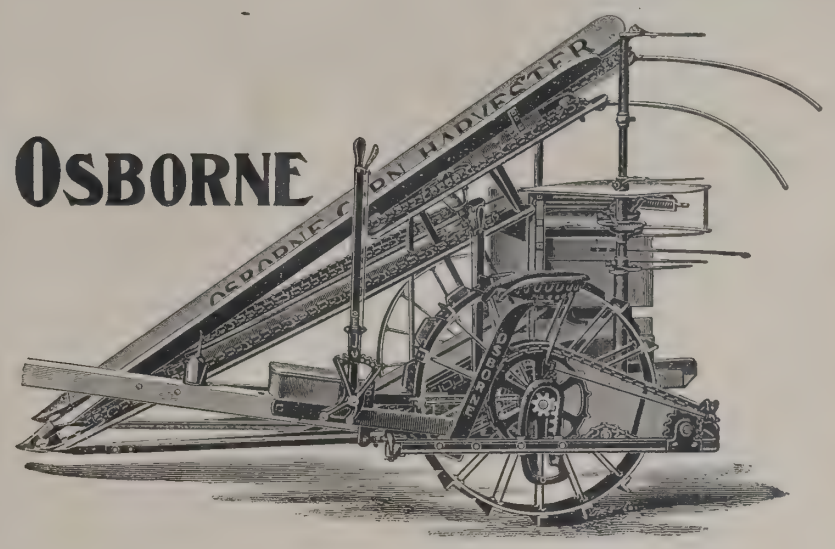
Middlefield, Ohio.

BUFF JERSEY—Dear Sir:—Some time ago I read of your method of using vaseline in milking, in HOARD'S DAIRYMAN, and at once gave it a trial. I would now hate to part with the practice. I made up my mind that anyone with so many clever ideas in their head could put out a book that would be of much value to a young man like me, so I enclose 25 cents in stamps for a copy. S. E. SWEET.

As I watch our cows either in the stable or pasture these days of fly torment I can not but feel thankful for the knowledge of, and the possession of, a repellent that keeps our cows comfortable. I have used this repellent for the past eight years and by repeated tests have found that the fly plague costs us a greater sum than any dairyman can afford. It has amounted with our herd to as much as 10 per cent in one day's test. Not only do we suffer the loss of milk, but also have our cows shrink in weight. I was very much surprised to hear such a veteran as my friend Gurler is, make the statement at the Wisconsin Dairymen's Association meeting that he never could see any difference in the milk yield of cows that were kept free from flies and those not. I never conducted an experiment along this line but what I got a shrinkage the first day the flies were allowed to torture the cows. And, laying aside the mere matter of gain or loss, the humane man will use the repellent to give his cows comfort alone.

The value of skim milk is often discussed in the farm journals, but the range of values as put by the writers are so wide apart the average feeder can not tell where he is at with his by-product. Skim milk, like ensilage, has a value not apparent to the chemist, or the day, week or month experiment conducted at our stations. In pig feeding we, who have largely depended on skim milk, find that we not only have a valuable feed to produce pounds of meat, but also have a health promoter and developer that makes our individual herds almost a breed in themselves. With us, in past four years, with a large amount of milk fed to Berkshires, we have as a result 100 hogs and pigs that are all strong of bone, long bodied, broad as to back, and show every indication of perfect health. There is not among these hogs one that is in the least out of condition. At this writing these hogs are getting less than two bushels of corn, they have 600 pounds of milk daily and are in rape so high that a 500-pound hog can not be seen in it.

The corn crop in this section is very backward. We have some that is tasselling and some not yet knee high. The prospect for filling our silos is poor, owing to the scarcity of help. Men are in demand in the hay and harvest fields at $2.00 per day, and at the price can not be had. Well, we can do the next best thing. Our College Faculty can put corn in the shock and then wait till all farming operations stop for winter, then run the corn through a husker and shredder. The shredded fodder we will place in a steam chest and steam well, enough for a day's feed. This way gives as good results as does ensilage. We know this from some years' practice. It is only a matter of cheap steam which we have with coal at two cents per bushel.



Monmouth, Ill. BUFF JERSEY.

D. M. Osborne & Co., St. Louis, Mo. Caledonia, Mo, June 1, 1903.

My Dear Sirs—I feel I honor my own judgment, and reflect only that which is justly due your corn harvester, when I say it is without doubt the best corn harvester on the market to-day. Last season I cut, on my own farm, 115 acres of corn, and a negro boy 16 years old managed the machine, drove the horses and did all the cutting, without one cent expense for repairs or breakage. The work could not be excelled. The corn was heavy and much of it down, and some full of weeds, but it made no difference to the machine. All corn looks alike to an Osborne Corn Harvester, and to Missourians your machine is peculiarly adapted, for it can most certainly "show them." I am, Yours very truly,

W. R. GOODYKAUNTZ,
Ex-Senator of Missouri.

OSBORNE

This Corn Book tells about Silos and Fodder. Book Free for the asking.

Scotia, N. Y., April 15, 1903.

D. M. Osborne & Co., Auburn, N. Y.

Dear Sirs—I am well pleased with the Osborne Corn Harvester I purchased of your agent, G. H. Bevis, last fall. It proved to be all it was commended. On account of the season, several places in our corn fields were deep mud, but when we cut there the machine worked just as good. The broad-faced steel drive-wheel is a great advantage on ground where it is soft. We used only two horses, and did the work easier than some of our neighbors did with three horses on another make of machine. It is certainly a very light runner. It is also a fine binder, never once having broken the twine, or missing to tie, thus using less twine than others, besides delay and trouble. I would say, in a word, that the machine is practically perfect. Very truly yours, CHARLES P. SANDERS.

A Small Mississippi Barn Plan.

ED. HOARD'S DAIRYMAN:—I have been thinking more about my barn and send a ground plan, about which I would like some information. Do you think it would do to have manure pit where it is shown in plan, or would you advise me to floor the space between the bin and set the pit as indicated by dotted lines? I prefer not to have double door and a drive way as that would necessitate putting the floor above eleven or twelve ft. high, and I have in mind to put the floor 7½ or 8 ft. What would you advise? Where in this barn would be the most convenient place to put steps leading to upper floor? The ground in front is almost level clear across front of barn, so that a wagon can be driven in front and hay thrown into loft, and cotton seed hulls can be thrown in through an outside door to bin. Corn and oats will not give much trouble to deposit as not much will be used- By placing barn 15 feet to

right, I can have all of it on level ground. Would you advise putting it there? Teaching is my profession, but teachers require food for their families and themselves, and the only way to get the milk and butter part of it pure here, is to own your cows and do the milking yourself. I was reared on a farm and revert naturally to that life for an hour or two each day to attend my cows, my chickens, pigs and garden, together with a small orchard planted in oats, corn and peas, as they come in succession; all of which promotes my health, tends to economy and above all keeps my babies (twins) supplied with food that I know is pure as food can be had. M. L.

Clinton, Miss.

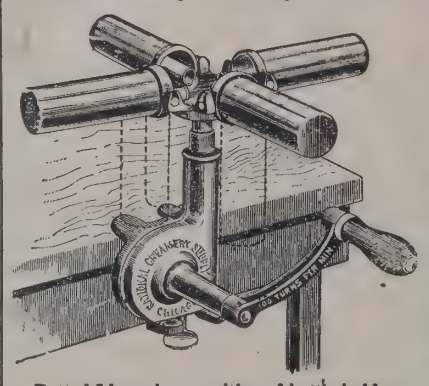
No one can but admire the arguments adduced by Prof. M. L., which induce him to engage in dairying on a small scale, and for ourselves, we feel certain that he will find a great deal of pleasure and a fair amount of profit from his undertaking.

We give below the outlines of the plan he submits for our consideration, and by use of dotted lines, submit our suggestions for sub-dividing the proposed structure. We would do away entirely with the proposed manure pit. A pit of the dimensions suggested would very soon fill up. We would much prefer to dispense with this, and scatter the manure from the horse and cow stalls in the open shed where the young stock, and possibly the older stock when out, will tread it down and keep it in the best sort of condition for fertilizing purposes. The building fronts to the north, and as will be seen, we suggested that the stairs be placed in the northwest corner of the building and we allow about 2½ feet for this stairway. A very convenient harness room and a bin for oats or other feed for the horse can be arranged for beneath the stairs. The present writer has such an arrangement in his own town barn and finds it to answer a very excellent purpose.

Next to this stairway comes a passage 5 feet wide for leading the horse in and out, and next to that, a stall for the horse 5 feet wide. On the opposite side, provision is made for three cows, with a feeding alley 2½ feet in front of them, and three feet space allowed for each animal. This encroaches somewhat, with a sufficiently wide passage behind cows, upon the bin for corn, oats, etc, but this can be extended as shown on the diagram, if, indeed, such a bin be considered a necessity. One trouble with the plan as shown, is that there is no floor space available for storage of various implements, which can be very conveniently kept in a barn. If at all practicable, we would therefore dispense with this bin for corn, oats, etc, and put such a bin in the upper story, over the place reserved for cotton seed hulls, perhaps. We locate the stair-way as shown, for the reason that the entrance to the loft should be in the same end (or side) of the barn that the hay is taken in at, and the scheme for feeding should be so arranged that the last forkful of hay put into the barn should be the first one to come out.

A Progressive Pennsylvania Dairyman.

Trouble with Silage and Cows.



ED. HOARD'S DAIRYMAN:—As there seems to be no phase to the dairy question that you cannot give some information on, I will try and give an account of our doings in the dairy. We deliver our milk to a creamery, have it skimmed and the milk returned, and get pay for the butter fat according to Babcock test, but I want to write about the farm end of the business.

I am trying to keep up with the latest dairy methods by studying the DAIRYMAN and practicing its teachings. I am trying to improve the milking qualities of my cows by breeding to a full blood Ayrshire bull.

Thinking that the basement of my barn was not suitable for cows, I built an addition, 30×40 feet, against the end of the barn for a dairy stable; cow stalls along

JERSEY BULL, one year old. Good individual of the best breeding. Also 7 months bull from tested dam. Herd headed by Fontaine's Owl, 60436. Prices on application. Address,
J. F. EGERTON, Footville, Rock Co. Wis.

one side and end (cement floors with gutter) to accommodate 15 cows.

Silo is in the entry in front of cows, extending far enough above the roof to give 28 feet depth. Silo is 10 feet×10 feet with corners cut off. The foundation is hollow tile, 8 in.×8 in.×12 in., 2½ feet high, cemented on inside up to where it joins the wood, then double boarded horizontally with tar paper between; good matched lumber inside.

I have had it filled two seasons now and it does not keep very satisfactorily. I cover with wet chaff tramped down for a few days after filling, and yet it spoiled down two or three feet last year and this year it spoiled about the same from the top; then it came in good, clear out to the sides until it got nearly to the bottom, where it was nearly all spoiled; so bad that stock would not eat it, and there is a couple of feet of silage (or manure) in the silo yet. The corners are cut off with matched lumber 1 foot long, the opening closed at top and bottom.

The stable is double boarded with tar paper between; lighted with three windows, two on one side and one in the end; ventilated by dropping the windows in at the top six inches, with sides closed so as to give the air an upward draft and not direct on the cows.

I fed about a bushel of silage at a feed twice per day, with two pounds of old process oil meal per day, or four pounds wheat bran, or both oil meal and bran in connection with the silage; also what clover hay they would eat up clean; and yet they dried up in their milk, one three months and two others two months sooner than they ought to.

One cow's feet got sore and she dried up in milk and got poor in flesh in spite of all we could do for her. Another good cow acts strangely, although she does not seem sick, as she eats well all the time, but she goes around with her nose close to the ground and froths at the mouth and cannot control her actions, but walks with a staggering gait.

Our milk test for June is 5.1; price of butter fat, 18¼ cents per pound. Our milk averages over $1 per cwt., with skim milk to feed pigs and calves.

I think dairying is all right, and I think it all right to take a paper like HOARD'S DAIRYMAN, devoted to dairy interests, and would like to have your candid opinion in regard to my stabling, silo and cows; why they should not yield a profit under these conditions. D. G. S.

Clarion County, Pa.

We are at much loss, even to imagine what may have occasioned the damage to the silage. It is easy enough to think that possibly the trouble with the spoiled silage on top, results from the unusual small cross section of the silo. The friction on the sides of a small silo is comparatively much greater than on the sides of the larger silo. It is perhaps not much to be wondered at, especially if the silage was not well tramped, and the outer edges kept considerably higher than the middle, that the air may have penetrated for quite a little distance at the top; but we are surely at a loss to understand why there should be spoiled silage after passing through a considerable distance in good condition. Of course, there may have been more or less of an opening where the wooden part of the silo joins on the foundation, letting in enough air thus to insure fermentation and decay. In filling this silo again, look well to this connection, see that it is securely stopped with clay. Keep the silage well tramped, especially about the edges and corners, and when the filling is completed, put on five or six barrels of water.

We are equally at a loss to determine why these cows do not hold up in their milk. A bushel of silage with all the clover hay a cow will eat and the grain feed mentioned, ought to enable the cow to hold out in her milk. There must have been, in our judgment, other causes than anything connected with the feed, to occasion this shrinkage. The circumstance that the feet of one of the cows got sore and that another cow acts very strangely indicates that if there is a competent veterinarian anywhere within call, he should be requested to give the animals a thorough inspection.

Dairying With Good and Poor Cows.

ED. HOARD'S DAIRYMAN:—To a man whose business brings him in contact with dairymen all over the country—the number of poor dairy herds encountered and the still poorer methods of handling them, must be to a practical dairyman a matter of surprise and regret, more especialy when it is known that the gray matter of Hoard, Cobb, Gurler, Gould, Henry, Wing and others, can be rented through the DAIRYMAN, for a dollar a year.

To the thinking, systematic man who conducts dairying as a business, for the profit derived from it, the outlook is encouraging. To a man who keeps cows as a side line, in a shiftless, hap-hazard way, the business can never prove satisfactory.

An old story is told of Plato (not Jas. M. Plato) who having described man as a biped without feathers, Diogones placed a plucked rooster before him and said: "Behold Plato's man." The shiftless dairyman may be compared with a plucked rooster, if he ever grew feathenough to pluck.

Few men in any business or profession, have learned absolutely every thing pertaining to their calling;the wisest of them admit that they can learn more. While it is right and desirable for a man to be self-reliant and to have faith and confidence in his own powers and abilities, he should not be so set in his ideas as not to see his mistakes and rectify them.

Many dairymen are apt to carry the idea that their own herd is the best, and their product the best that can be turned out, and when they hear of a better herd and better products, are apt to treat it as a a fish story, instead of raising their standard. The fact is, that thorough judges of dairy cows and dairy products, are found only among those who are thoroughly trained as judges and taught in the making of the product. Whatever stock is kept by the farmer, the best and nothing else should be kept, or bred.

The difference in the expense of rearing the good and bad is nothing. The one is an honor to man's judgment and taste, the other dishonors his judgment and condemns and vitiates his taste and drains his purse. The one at any time may be converted into cash, the other is a moth that eats, but does not sell and can rarely bring its real cost.

The demand for good, selected dairy cows is not transient. It is permanent and is bound to continue so for years to come. In all purposes for which we require cattle, well bred stock must, in all cases, be resorted to for improvement. The first thing of importance in a dairy is good cows, backed by intelligent feeding and good care. A poor cow requires as much feed, often more than a good one, and the same care.

In a dairy of picked up cows, half of them may yield from 40 lbs. up and the other half from 40 lbs. down. Dairymen are apt to look at the general results of their dairy and not at the comparative differences and values in their cows. Half of the herd made the profit, the poor cows getting credit and saving themselves from the butcher where they ought to go. The same cash result would have been realized without them and the feed consumed and labor required could have been sold for a better price to better cows.

The McAdam & von Heyne Sale.

ED. HOARD'S DAIRYMAN:—The sale of the McAdam & von Heyne herd of Holsteins, at Deansboro, Oneida Co., N. Y., at the Brotherhood Stock Farm, July 15, 1903, was a notable one, both because of the reputation of the stock that was offered for sale, and because of the prices that were paid. Among the cows were Mecedes Julip's Pietertje, which for some time previous to Sadie Vale Concordia's test of last winter, held the world's highest record for butter by an official seven-day test, and Sadie Vale, herself, the cow that now stands in that enviable position. There was also the noted sire, Sadie Vale Concordia's Paul de Kol, whose eleven nearest dams are said to have records that average 23 lbs., 6 oz. of butter in seven days. These, in addition to the numbers of other very attractive animals, made a collection that was able to bring together most of the leading Holstein breeders of the east, and even called men from well into the west.

The sale commenced at about eleven o'clock in the presence of a large and interested group of breeders and farmers. It was estimated that fully five hundred were present at the sale. The utmost good nature prevailed, and at times the bidding was quite spirited. The whole herd of seventy-three animals was sold in about six hours' time.

After a few of the lesser important sales had been made, Sadie Vale Concordia was brought into the ring. Everybody was now on the tiptoe of expectation, but the bidders were cautious. The first bid was for $1,000, by Mr. Matteson. Advances for a hundred or two were rather slow, then followed a brisk rise to $1,800. From this point on it became a toilsome endeavor to advance the price. Only a few bidders were in the race, and finally, this world-renowned cow was struck off to L. J. Fitzgerald, of Courtland, N. Y., for $2,200.

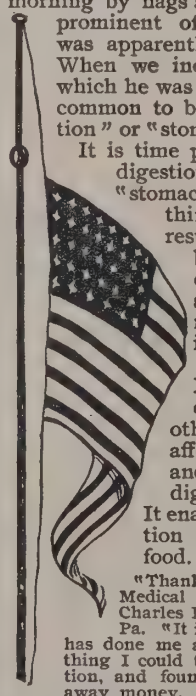
She has always been a New Yorker, having formerly been a member of the Yoemans' herd, at Walworth, where she made an excellent record for herself. Since being purchased by Messrs. Mc Adam and von Heyne, she has been subjected to an official test, as is known by all high grade breeders of Holsteins. That test is reported at 30 pounds, 2 ounces of butter in seven days; 123 pounds, 10.7 ounces in thirty days; 220 pounds, 8.4 ounces in sixty days. The official part of this test is I believe confined to the seven days as reported, although other official tests were made coming within a fraction of the highest seven days.

It should probably be mentioned that these records are based upon the old method, known as the eighty per cent butter fat test. Translating this to conform it to the new rules of the Association, as was done by HOARD'S DAIRYMAN last spring, it would read 28 pounds, 9.6 ounces of standard butter. Sadie Vale Concordia is the world's champion and the price paid for her is the highest ever paid for a Holstein cow. If she lives till the 28th day of October she will be eleven years old. Had she been a few years younger it is probable that a higher price might have been paid.

Mr. Fitzgerald is to be congratulated on becoming the owner of so notable a cow; the breeders of New York that such a cow has been bred and is retained within the state; and the Holstein breeders that they possess the world's champion cow by official test. It might be of interest to state in passing that the son of Sadie Vale by Beryl Wayne's Paul DeKol was purchased by H. Stevens & Son a few months ago for $4,000, to be delivered when six months old. Sadie Vale was served April 26th to Sadie Vale Concordia's Paul DeKol.

Following this sale was one of Sadie Vale Concordia 2nd, born August 22, 1900, to Stevens Bros. for $400; of Sadie Vale Concordia's Beryl, born January 30th, 1802, for $550 to H. A. Moyer; of Sadie Vale Concordia's Granddaughter, born August 16th, 1902, to Mr. Fitzgerald for $355. Mr. A. N. McGeoch, Milwaukee, then bought America De Kol Pauline for $355, after which followed another one of the chief attractions, the sale of Sadie Vale Concordia's Paul deKol. Three years ago this animal sold for $250 it is said. The bid of $300 was first made, but ran up rapidly amid some enthusiasm, and when Mr. Fitzgerald called $2,300, the announcement was greeted with applause. That price brought this excellent sire to Courtland with his noted mother.

There was a little surprise expressed regarding Mr. Fitzgerald's purchases, but he quietly remarked that he had played "second fiddle" long enough. Mr. Fitzgerald is not so old a breeder of Holsteins as some others in the state, but he has had many years of experience as a breeder of horses and cattle, and he had a choice collection of Holsteins previous to the purchases made by him at this sale. Breeders are likely to hear from him in the future. A few other sales were made, after which, the auctioneer announced a lunch on the lawn.



In addition to the gentlemen named, there were present Henry Stevens, the president of the Holstein-Friesian Association, who has been a breeder of Holsteins for twenty-seven years and is one of the very oldest breeders in the country. With him were his three sons, two of them now in business by themselves, as Stevens' Bros., and a younger son who is in the firm of H. Stevens and Son. Also O. N. Kellogg and H. L. Bronson of Courtland, W. A. Matteson of Utica, F. C. and W. C. Hunt of Syracuse, T. A. Mitchel of Weedsport, Mr. Moyer and Mr. Averill of Syracuse, Frank W. Ames of Morristown, S. Burchard of Hamilton and Frank Peer of Holland Patent. There were many others, greater or lesser lights in the Holstein breeders' world, many names that it was difficult to get in the crowd. Among those from out of the state were H. B. Daggett of Wisconsin, M. Cortelyou of New Jersey, F. J. Tompkins of California, James Graham of Patterson, F. P. Knowles of Massachusetts, J. V. Shugart of Indiana, and Geo. Rice of Canada. The Illinois Experiment Station was represented by Prof. Frazer, and Cornell University by Prof. Wing. Many of the gentlemen named in these lists were heard from at intervals during the day.

During the recess for luncheon it became evident that opinions had been very different as to the price at which Sadie Vale would be sold, while in the morning the best judges had been disposed to keep strictly their own counsels. Some thought the price enormous, while others had expected to see her go at a number of hundred dollars higher, even as high as four thousand being the estimate of some.

When the sale was called in the afternoon and a few animals had been disposed of at moderate prices, Mercedes Julips

AT HALF MAST.

Sometimes we are greeted in the morning by flags at half-mast for some prominent official who yesterday was apparently in perfect health. When we inquire the ailment by which he was stricken it is not uncommon to be told "acute indigestion" or "stomach trouble."

It is time people learned that indigestion or any form of "stomach trouble" is not a thing to trifle with. The result may not be fatal, but there can be no condition of diseased stomach which does not carry with it physical loss and weakness.

Dr. Pierce's Golden Medical Discovery cures indigestion and other forms of disease affecting the stomach and its allied organs of digestion and nutrition. It enables the perfect digestion and assimilation of food.

"Thanks to Dr. Pierce's Golden Medical Discovery," writes Mr, Charles H, German, of Lehighton, Pa. "It is the only medicine that has done me any good. I tried everything I could think of to cure indigestion, and found I was only throwing away money. Then I heard of Doctor Pierce's Golden Medical Discovery and tried a bottle of it, and to my joy found it was doing me good. I used six bottles of it, and am now cured. It is the *best medicine on earth.*"

This grand remedy does its work in a thorough manner; it gives the health that is all health; the strength that is solid, substantial and lasting; not flabby fat, not false stimulus, but genuine, complete, renewed vitality and life force.

Accept no substitute for "Golden Medical Discovery." There is nothing "just as good" for diseases of the stomach, blood and lungs.

Dr. Pierce's Pleasant Pellets cure constipation and its consequences.

The New 1903

REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

Pietertje was brought into the ring. Her official record made while in Minnesota as the property of T. J. Tompkins, owner of the South Side Farm, was 29 pounds, 5.7 ounces of butter in seven days. This was then the highest official record ever made, and the championship she held till last winter, when Sadie Vale took it from her. It was stated, though unofficially, that she has given 90 pounds of milk a day for seven days, which averages slightly better than 4 per cent of butter fat. If she can do that on an official test, she will win back her laurels from Sadie Vale.

The Mercedes cow is smaller by probably 200 pounds than her successful rival, but her udder and the veins are truly wonderful. Her milk-producing "machinery" must be of the finest order. She is younger by some years than Sadie Vale, and will be eight years old the 10th of next October. She walked leisurely around the ring while the auctioneer recounted her favorable points, seeming to take rather less seriously the gravity of the situation, perhaps realizing that she had a somewhat lesser responsibility than had her associate, Sadie Vale. It was remarked that she was once purchased at $200. The first bid was for $500. There was some spirit manifested in the bidding, but the last few hundred came slowly, but $2,000 was finally called by W. T. Housinger of West Chazy, New York, and she was sold to him at that figure. She was bred June 8 to Sadie Vale Concordia's Paul de Kol.

At one time during the sale of Mercedes, just as Col. Jones, the auctioneer, was looking in the opposite direction and threateningly announcing "down she goes," the cow demurely stopped and laid down on the planer shavings which carpeted the ring. This, of course, brought out a general laugh, and a remark: "There, Colonel, you have talked her to death."

Following this sale was that of Mercedes Julip's Pietertje 2d, to F. E. Gans of Utica, for $665, and Mercedes Julip's Pietertje's Granddaughter, to L. J. Fitzgerald, for $400. The three generations were brought into the ring together for an exhibit, and it was one worth seeing. Frank Peer of Holland Patent, bought Canary Mercedes Johanna de Kol, for $495, and Sir Pietertje Posh, born Nov. 20th, 1900, was sold at $675, to F. E. Gans. There appeared to be general surprise that this bull did not bring more money, as he is a fine animal, and has a fine record back of him.

Mr. Fitzgerald bought several other fine animals at good prices. Mr. Daggett made some excellent selections at very good prices as did the Stevens and Mr. Tompkins. There were a number of good young animals that went at moderate prices and many of them, it appeared, were purchased by farmers to put into their dairy herds. Nothing went at less than $25 and not more than three or four went at less than $50. Perhaps a dozen or fifteen sold at prices between $50 and $100, and twenty-five or more between one hundred and two hundred dollars. At the time our train left it was impossible to get an average for the entire sale, but of sixty or over, that it was possible to get, the average was enough above $300 to make it probable that the entire average could not have been much, if any, below that sum.

Col. Cary M. Jones of Iowa, the auctioneer appeared equal to every emergency, and kept the people in excellent humor. He appeared to be conversant with the reputation and breeding of the animals.

Mr. McAdam put forward the animals and sold without reserve. He is entitled to much credit for having made so notable a collection in so short a time. In some ways it seems unfortunate that the herd should be broken up, but this is offset somewhat by the fact that the animals have gone into good hands. Mr. von Heyne has had the good fortune to be associated with men who have owned many famous Holsteins. He has proved himself to be an excellent judge in the matter of feeding for high records and in handling the animals preparatory to and during the test. It is understood that the firm of McAdam & von Heyne will now be dissolved as Mr. McAdam has so much other business that he wishes to sell his farm and give up cattle breeding. H. H. L.

N. Y.

About Seeding to Alfalfa.

ED. HOARD'S DAIRYMAN:—Was much interested in an article in last week's DAIRYMAN in regard to alfalfa raising on the Editor's farm. Have about made up my mind to make a trial, although repeated failure of others in this town to get a stand has discouraged me heretofore. Would like advice on the following:

Have a piece of new seeding of about two acres which lays on side hill in rear of barn facing the east, which I mowed July 1st. A splendid second crop of clover is coming on and my plan is to plow this clover under and seed to alfalfa next spring, with 1½ bushels of oats as nurse crop.

1. Should I plow deep or shallow?
2. Should the clover be plowed under this fall or allowed to lie down and turned under in the spring?
3. Will the second crop of clover plowed under every third year keep the land up without applying stable manure?

Sherburne, N. Y. H. J. K.

We are of the opinion that it will not pay to plow down this second crop of clover, but rather, if it is not wanted for forage, to let it ripen and save the seed. Probably, the most valuable part of the clover plant for manurial purposes is below the surface of the ground. In other words, the roots of the plant contain probably more fertilizing value than the crop above the ground.

Answering the specific inquiries submitted we would say, (1.) Do not plow deeper than has been the custom, but if the soil is not fairly porous, it would be a good plan to run a sub-soil plow in each furrow, but not turn the deeper soil to the surface.

(2.) Subject to what has been said above about plowing down the clover, we should prefer to plow this soil in the fall, let it become fairly well compacted, and then in the spring, go on with the disk harrow, a digger or some implement of that kind, and make a well pulverized seed bed about two inches deep.

(3.) It is probable that the plowing down of the second crop of clover every third year will furnish the soil with sufficient nitrogen, but it will add nothing to the phosphoric acid and potash which are essential for the growth of crops. Some soils are abundantly supplied with these elements and practically need nothing but nitrogen. Others are very deficient, especially in potash.

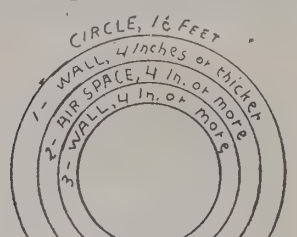
Dairying With Good or Poor Cows.



(Continued from page 577)

While it is always safe to buy a good cow, dairymen should as far as possible replenish their stock with calves from their best cows and a good bull. If the dairy is carefully selected, the annual decrease and change will be small so that the calves raised need be but few and more carefully selected and cared for. Some strains of the same blood are noted for their propensity to fatten, some for dairy qualities, size, beauty of color, form and marking, etc., and the dairyman who depends solely upon buying, has not only to take these things into consideration, but he will find that, however honest and conscientious a seller may be, he is not, as a rule, very communicative on the bad qualities of the animals he condescends to sell. J. H.

Oswego, N. Y.

A Silo Plan.

ED. HOARD'S DAIRYMAN:—I send you a sketch of a silo, covering all that is wanted in a silo. I have had a dairy and milk wagon for a number of years without a silo, but have had to give it up, and am again to build one in the spring. After coming to that conclusion, I com-

menced to look for a perfect silo and could not find one to my notion. I believe this will be a success, so much so I have applied for patent on the tools for laying it. Every foot you lay up, after you have got a good foundation, we put a No. 9 wire in outside wall clear around, which makes a hoop; also across the air space is wire bent Z as in the circle, making the wall very strong. G. E. M.

Albion, Mich.

Act Regarding Labeling Cheese and Butter is to be Enforced.

Will Stop Practice of Falsely Marking Butter and Cheese for Interstate Commerce.

There is trouble ahead for those who deal in wrongly labeled cream cheese or creamery butter, making it in one state and placing it on the market in another state as an article of interstate commerce.

Congress legislated against that pratice in 1902, but the law has not been enforced. Now the Secretary of Agriculture is convinced it should be made operative. He has co-operated with the Attorney General to that effect with excellent results, and there will be "things doing" for violators of the law from this time on. Violation is a misdemeanor, punishable by fine from $500 to $1,000.

Although there is no disposition on the part of Secretary Wilson to make this law a burden, he is determined that some of the glaring evils which might be obviated by its application shall cease.

To this end he has submitted several hypothetical cases, on food products wrongly labeled as to place of manufacture to Attorney General Knox, who has responded by rendering just the construction that was wanted.

And not only has the attorney general made the application as to goods manufactured in this country, but he has construed the law as being in connection with the act giving the department of agriculture authority over foreign food products which may be brought to this country, and then labeled falsely regarding the place of their orgin.

Since the passage of the 1902 law, which is called the Sherman law, many food manufacturers have submitted their labels to the department of agriculture for ruling as to whether statements made on them were violation of this law.

In a package containing sixty labels of various food products submitted by a manufacturer last week, every one, with but one exception, was declared to be in violations of the law.—*Washington Correspondence.*

For the land's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it.

Warranted Pickle for Pork.

ED. HOARD'S DAIRYMAN:—After reading for some time the practical and up-to-date DAIRYMAN, we were somewhat surprised at the old-time recipe you gave the Down South Dairyman for meat. Here is a recipe we have tried for several years for curing meat for family use and guarantee it for our climate (southeastern Indiana), and do not see why it would not be just as good for a much warmer one.

For 100 pounds pork: 10 lbs. salt, 2¼ lbs. brown sugar, 2 oz. pepper, 2 oz. soda, 2 oz. saltpetre.

Pack meat in barrel. Boil and skim brine. When cool, cover meat. Weight it down and be sure it is all covered. Add pepper after skimming. Let remain in brine four to five weeks, or until salt enough. Smoke and let hang in an open dry place. Rub well with powdered borax and no insect will ever bother it.

Some use almost the same recipe, but rub it on the meat dry. We prefer the brine, then the meat is covered immediately.

We like this meat much better than the sugar cured on the market; often keeping hams until harvest.

Vevay, Ind. (MRS.) G. C.

We are much obliged to Mrs. C. for the foregoing recipe for curing pork. We shall not hesitate to try it ourselves this fall, and doubtless, many of our readers will preserve the recipe for use. Meantime, if other readers would follow the example of Mrs. C. and give their brethren the advantage of some of these well-tried formulas for various purposes, they would be doing for others as they would have others do for them.

Testing Cream.

ED. HOARD'S DAIRYMAN:—A patron is selling three cans of separator cream every week. If sent to local creamery they make what they call a composite test twice a month. If sent to a cold storage company, they make a separate test of each can as received. Both claim that their plan is the most correct way of testing. Both claim to use the Babcock test. Now which is right? And which is best for the patron? Both, of course, pay on basis of butter fat as shown by test. N. S. F.

Berlin, N. D.

Both methods of sampling and testing cream mentioned may be used correctly for determining the amount of fat in the different shipments of cream. The accuracy of the results depends entirely on the

ILLUSTRATION.

THIRTY-FOUR POINTS FOR A MANURE SPREADER.

In the large catalogue, 10 by 14 inch pages, of the Smith Manure Spreader Comany, of Chicag the very first page may well hold the reader's attention for a considerable time, it being given up e tire to "thirty-four reasons why you should have a Great Western Endless Apron Manure Spreader This matter of course was intended to apply to the Great Western Spreader. The array of reaso presents a strong case, conclusive, we think, of the whole matter. Many of the reasons, howeve are general and apply equally well to any good spreader, and as such are worthy of careful study every farmer who is interested in the mechanical distribution of manure, whether he has any pred position toward the Great Western Spreader, or not. The matter of spreading manure by machine has received a good deal of attention within the last year or two. The necessity has been presented strong lights, but we think not too strong. A remarkable feature about it is that there seems to be b one side to the discussion. Wherever a spreader has been tried, users are unanimous in the opini that the manure spreader is one of the most necessary and valuable pieces of machinery ever invent for the farmer's use. Among spreaders, it goes without saying that in our opinion this Great Weste Spreader is one of the most valuable in the field. It was not the original spreader. Coming late, was able to remedy the short comings and defects of other machines, employing ideas that were go and obviating weaknesses, thus taking high rank from the start. The advertisement has been runni for a considerable time in our columns. Once before we had a word to say, editorially, in favor of most prominent features. To appreciate its true value to the farmer we can do nothing better th commend readers to a study of the "thirty-four reasons" mentioned above, and the detailed descri tions and full page illustrations which follow in the catalogue. This catalogue may be had free charge by writing the Smith Manure Spreader Co. at the address given in the advertisement.

HUSK YOUR CORN, SHRED YOUR FODDER, SELL YOUR HAY

carefulness with which the work is done. The two systems of sampling and testing are something like two ways of measuring cordwood, one of which may be to measure each load as it is delivered, and another to allow the loads to accumulate until one large pile is made and then measure it.

Taking a composite sample of cream and testing twice a month is less work than testing each lot of cream as it is delivered, but I think that both methods may be used in a satisfactory way for determining how much butter fat the cream patron delivers to the buyer. The cream producer may keep a check on the method of testing his cream, by investing a small amount of money and time in a Babcock tester at the farm.

E. H. FARRINGTON.

Madison, Wisconsin.

Alfalfa for Pigs in Oklahoma.

Potatoes for Swine.

ED. HOARD'S DAIRYMAN:—In last week's DAIRYMAN I saw a letter from a man in which he says he fed pigs on one pound of corn per day and all the green alfalfa they cared to eat, and that they made a gain of ⅙ of a pound per day.

I had three sows running on alfalfa pasture and they farrowed 20 pigs the 15th of last December. They have never been taken off the alfalfa. I fed the sows twenty pounds of corn per day, or one pound per each pig, till the pigs were taken off. Since the pigs were taken off I have fed them one pound of corn each per day. When the pigs were 210 days old they weighed 120 pounds, a gain of 4-7 of a pound per day.

I have about 200 bushels of potatoes that are too small for the market. What are they worth cooked and fed to my hogs with corn at 50 cents per bushel.

Shawnee, O. T. J. J. J.

The evidence is accumulating very rapidly that alfalfa is to be the rival of corn in the production of pork, and the wise farmer and dairyman will give this subject his earnest consideration.

Experiments conducted at the Wisconsin Station showed that boiled potatoes fed in connection with skim milk had about one-fourth the feeding value of corn which was also fed in connection with skim milk. Therefore, when corn is worth 50 cents per bushel, potatoes should be worth one-fourth as much, less whatever it may cost to cook them.

Wetting Ripe Corn for Silage.

A Great Success Reported from Missouri—Relative Values of Bran and Middlings from Spring and Winter Wheat.

ED. HOARD'S DAIRYMAN:—We think you asked the result of watering silage when put up as per your advice last year. We watered rather more, we think, than you instructed and are so well pleased with the result that we want to do the same way this season. Our corn was ripe enough to crib when put into silo. We will let it ripen again before putting it up this fall. We want no nicer, bright ensilage, and if we change and put corn up greener it might disappoint us.

Last year was our first experience with silos. We put up a cement one 16×35 feet, costing $450.00, with cement scarce and very high priced. We are sorry we did not build several years ago, and wish we had another for summer and fall use.

Kindly give difference in feeding value between by-products of spring and winter wheat for milk cows.

Foss, Mo. A. E. M. & BRO.

When it is considered that HOARD'S DAIRYMAN has fifty thousand or more readers, and that among this number a goodly percentage are interested in silos and silage, communications like the above assume a practical value that can not be estimated, much less calculated to a certainty.

If not asking too much of these correspondents, we would be glad to have them give us in detail the manner in which they constructed their cement silo, laying especial emphasis on the manner of arranging the forms and providing for the openings.

There is no material difference in the feeding value of the by-products from spring and winter wheat. Such difference as there is, according to the analyses, is in favor of spring wheat.

The Silo Roof, Is it Necessary?

ED. HOARD'S DAIRYMAN:—You said in a recent issue of the DAIRYMAN that the best keeping silage you ever had was in a silo without a cover. Would you recommend that plan in Middle Georgia? We have usually a good deal of rain during the winter. I commenced today to build a silo after the plan of Mr. Meroney of Dark Mills, Tenn., that is 8 ft. in the ground and 14 ft. above. If I can build without a roof, it will save ⅓ of the cost of the structure. C. M. S.

Penfield, Ga.

It is true that the best silage the writer ever had came from a silo that was without a roof from the time it was filled, about September 1, until Thanksgiving, a period of nearly three months. During this time we had an unusual amount of rain, and, in common with our neighbors, we expected to find a large amount of decayed silage. Shortly after the roof was put on we commenced to feed the silage and were most agreeably disappointed to find but a few inches of spoiled silage at the top and when this was removed, very excellent silage all the way down. In this latitude, with occasional heavy snow storms and continuous cold through the winter, we consider some sort of a cover to a silo well nigh indispensable, but for the Georgia winter there would seem to be but slight necessity, if any, for a permanent roof over the silo. At all events we should not hesitate to try it for one season at least, and, if during such trial, the rains seem to injure the silage, build a temporary covering that would shed the greater part of the water.

The Result of the Oleo Law.

W. W. Jermane, Washington, correspondent of *Minneapolis Journal* has sent that paper an article showing the good results of the oleo law, in which he says:

"Statements sent out in the press dispatches from Washington to the effect that the manufacture of oleomargarine has been increasing in the past few months, and that the output will soon be equal to that of last year, are not borne out by a careful analysis of the returns to the internal revenue bureau. As a matter of fact, the high water mark of production for the current fiscal year was reached in December and January, in which months more than 8,000,000 lbs. were produced. Since that time there has been a gradual falling off, in April, the last month for which the returns have been made public, reaching only 6,250,000 pounds. Friends of the oleomargarine bill which became a law last session claimed that by forcing the manufacturers and dealers to sell their product for what it really is, and not for butter, a decrease in the output, as compared with previous years, would result, and this appears to have been realized. The total output for the ten months ending April 30, 1903, was 64,986,181 pounds, as against 99,362,803 pounds for the corresponding period of the preceding fiscal year, when the old law was in operation, and all oleo, colored and uncolored, was taxed at the uniform rate of 2c a pound. The decrease in production is, therefore, 34,456,622 pounds, or 34.6 per cent. Taking it altogether, the new oleomargarine law, from the standpoint of protection to the consumer, may be said to be a success."

Used Ten Years

For Spavins, Ringbone, Splints, Curbs, and all forms of **Lameness,** bunches or bony enlargements.

Washington, D. C., Nov. 20th, 1902.

Dr. B. J. Kendall Co.,

Gentlemen:—Please send me a copy of your "Treatise on the Horse and his Diseases." We have **used your Kendall's Spavin Cure for ten years** and gladly testify to its merits.

Yours truly, JUSTUS C. NELSON.

As a liniment for family use it has no equal. **Price $1; 6 for $5.** Ask your druggist for **KENDALL'S SPAVIN CURE;** also **"A Treatise on the Horse,"** the book free, or address

Milked the Cow Six Years.

A Holstein Which Gave Milk Six Years Continuously—Too Little Care taken of Cows by Farmers—Coloring not Needed.

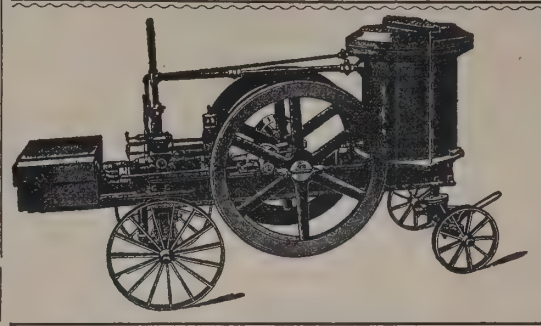
There is too little care taken of the general run of the farmers' cows to make good butter. Governor Hoard has been drumming this into the heads of the people for years, and it is a sad reflection that no greater progress is made. It is no reflection on Governor Hoard. On the contrary, it is a reflection on the intelligence and carelessness of the farmer. No matter how much is said, how many examples given, the ordinary owner of a cow goes on in the same old rut. Demonstrations are made every day by scientific owners of cows, showing how much more the animals will produce if they are properly cared for. The experimental stations of the varions states, are constantly showing what cows will do under good treatment.

To the ordinary business man it seems strange that a certain system can be shown time and again to the ordinary owner of cows, which system is unquestioned and which, if practiced, will produce better results, and not have it adopted. Practical buttermakers, men who have grown rich because they did treat, feed and care for the cow right, are always telling what can be done, and the cow owner goes right along in the same old, unbusiness like methods.

PROGRESS IS SLOW.

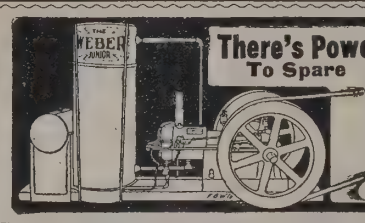
Governor Hoard declares that progress is being made, but it is slow. The various tests which are given every week in the dairy schools and elsewhere are of benefit, but the trouble is the cow owners do not give these the attention which they should.

Dr. E. F. Brush of Mount Vernon, N. Y., is one of the scientific cow men of this country. He raises cows for their milk and food properties. On his farm he has a factory to produce koumiss, a milk food for children and weak people. He was the man who sent some of this food to President McKinley, when he was ill in Buffalo, but even Dr. Brush's food could not overcome the assassin's bullet. Dr. Brush is considered an authority by those who know him. His experiments are many, but he is modest and does much good which is not known. For instance he demonstrated that a cow, with her ovaries removed, could be milked six years. He did this on his farm in Mount Vernon, and it is the only record of the kind in this country. The cow was of the Holstien herd, of which the doctor is very proud.



A RECORD BREAKER.

This cow was not permitted to eat all the grass she wanted, but was kept on a balanced ration the year around. During the summer she was given a certain quantity of grass, but was regulated more carefully than many mothers regulate the food of their children.



So far as the writer can learn, this is the longest record for a cow to give milk continuously. The other record is one of three years, but this is double that time.—*Fruit and Produce News.*

GOOD INTENTIONS ALONE CANNOT PRODUCE GOOD MACHINERY. Most all manufacturers are honest, but lack the experience and equipment necessary to turn out a thoroughly first class engine. We are the founders of the Gas Engine industry in the United States; have been building **OTTO** engines for 27 years, and operate the largest and most complete plant in the country devoted exclusively to the building of Gas and Gasoline Engines. St. Albans Foundry & Implement Co., St. Albans, Vt.

Short-horns Will be Represented in Dairy Tests at St. Louis.

(Continued from page 566)

Class B will consist of cows entered for demonstrating the economic production of milk for all purposes relating to dairying.

Class C will consist of cows entered for demonstrating all the products of the cow—viz., beef and milk, with their calves judged for their beef merits.

Class D will consist of cows entered for demonstrating the greatest net profit in the production of market milk on the basis of quantity and quality of milk of a given standard.

The committee to whom was referred the subject of a standard, or the conditions to govern the demonstration, recommended that the awards be based on the following dairy and beef elements:

1. The dairy performance of the cow in the yield of products as determined in the dairy demonstration at the exposition.

2. The beef conformation of the cow and her gain in live weight during the demonstration.

3. The beef merit as shown in the quality and growth of the calf and as a prospective profitable butcher's beast.

The points and their values considered by the judges in making the awards will be as follows:

	Percent.
1—Dairy performance of cow	40
2—Beef points of cow	35
3—Beef points of calf	25
Total	100

The committee who formulated the conditions was composed of H. H. Hinds, American Short-Horn Breeders' Association; Charles D. Nixon, Brown Swiss Cattle Breeders' Association; J. J. Richardson, American Jersey Cattle Club.

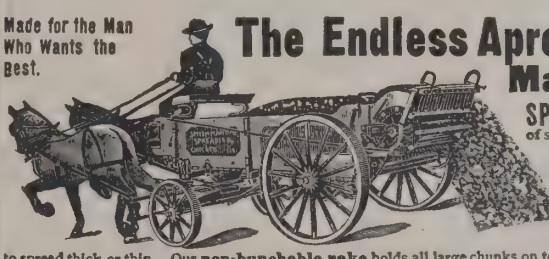
SAVES ITS COST ON THE FIRST CROP.

It spreads all kinds of manure, lime, salt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.

Do you know of any other piece of machinery for use on the farm of which this can be truly said?



The Improved Kemp Manure Spreader

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new **Beater-Freeing Device, Apron-Returning Device** and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about **"How to Grow Big Crops."** Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.

KEMP & BURPEE MFG. CO., BOX 46, SYRACUSE, N. Y.

Made for the Man Who Wants the Best.

The Endless Apron Great Western Manure Spreader.

SPREADS and **pulverizes** all kinds of manure, fresh, well rotted, mixed, full of straw or cornstalks, sheep manure. No matter how tough, we guarantee our spreader to spread it so evenly that one load will do more good than three spread by hand. **Endless Apron** is always ready to load. **No turning back** after each load is spread. **Front wheels** cut under and machine can be turned in its own length. **REGULATED** motion to spread thick or thin. Our **non-bunchable rake** holds all large chunks on top of beater until they **are thoroughly pulverized. Combined Hood and End Gate** keeps manure away from beater while loading and acts as wind hood in spreading. **LIGHTEST DRAFT** ever produced on a manure spreader, because front and rear wheels track and the load is nearly equally balanced on front and rear axles which brings load up close to horses. **Send for free illustrated catalogue** giving full description and how to apply manure to secure best results. **Saves time, labor, money.**

SMITH MANURE SPREADER CO., 59 N. JEFFERSON ST., CHICAGO, ILL.

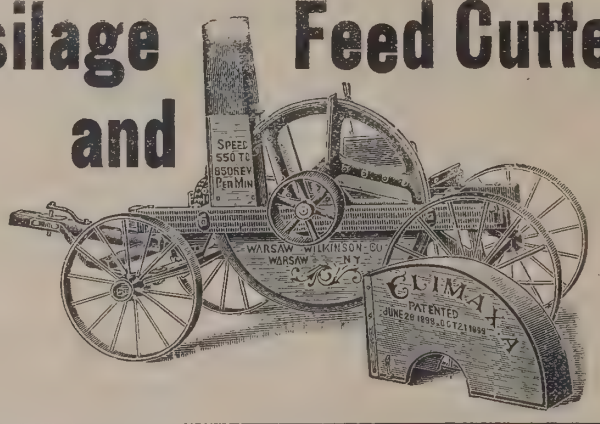
No. 20

ENSILAGE CUTTER



These cutters are built especially for Silo use and are strong throughout in their construction, with heavy frame built low to avoid extra staging or tables to feed from. The cylinder shaft is 1¾ in. steel and has 3 babbited boxes, making 13½ inches of bearing surface. The balance wheel is closed, weighing 170 pounds, secured by side headbolts on flanged collar, keyed on the shaft; the heads of these bolts turn ¼, in case of any obstruction reaching the knives, and allow the balance wheel and pulley free speed, while the strain on the knives is relieved at once. The traveling feed table is controlled by the reversible lever and is instantly stopped or reversed. The slats on these tables travel over a close bed, full length and are close together to prevent fine leaves getting into them and winding on the rollers, also guards over the chain links. The length of cut is easily adjusted from ⅜ to ⅝ and ⅞ inches by the gears on the shaft. We furnish chain elevators of any length desired, straight away or side delivery. Weight of Cutters with traveling table, 1600 pounds. Send for circulars.

CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true**. All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

The Old Way—Kicking Corn With Knife Fastened to Boot

FARMERS DON'T KICK NOW!

Their corn is cut with

DEERING IDEAL CORN BINDERS

Deering Corn Binders gather all of the corn. They do not waste. They are constructed on the grain binder principle; the corn is bound while in a horizontal position in the same manner as a sheaf of wheat. They do not knock off ears.

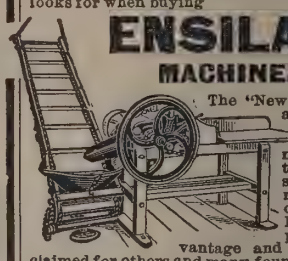
Deering Corn Binders, Corn Shockers, Huskers and Shredders

are money-makers for the farmer. Ask the nearest Deering agent for a "Deering Corn Annual."

The New Way—DEERING CORN BINDER in the Field

BLIZZARD

Safe, Strong and Efficient.



Cuts and Shreds all kinds of Dry and Green Fodder and elevates it to any desired height through a **PNEUMATIC TUBE.** No sprocket, no link belt, no elevator buckets, web, slats, etc. **Saves power, breakage and annoyance.** It cuts various lengths; **any capacity you want.** Call at your dealer's and examine it or write us for circulars and descriptive matter. &c

Joseph Dick Agricultural Wks., Box 20, Canton, Ohio.

"NEW HERO"

excels in strength and effective working qualities and sells at a price that "fits the purse." It is the combination of these three features in the highest possible degree which a practical man looks for when buying

ENSILAGE MACHINERY.

The "New Hero" Cutters are the simplest in construction of any made; so strong that, size for size, they weigh more than any others; they have every practical advantage and improvement claimed for others and many found in no other; they are guaranteed to outlast and outwork others. Sizes, 9 in. to 26 in.; with or without self-feed table; shredder attachment if desired; swivel feed carrier. We make also a complete line of sweep and tread horse powers, shellers, huskers, feed grinders, wood saws, windmills, etc. Remember that Appleton quality is the standard of excellence, and write to-day for free catalog.

FOUR BIG REASONS

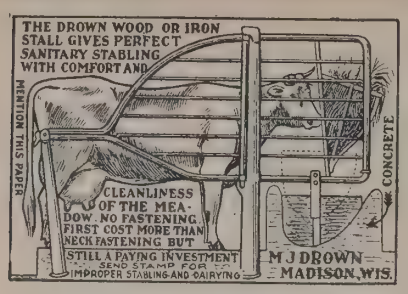
Why you should Give the

Dairy Tubular Separator

A Trial.

The Cream You Get
IS all there is to get. Practically the last drop is wrung from the milk. No other separator skims as clean. The Tubular machine will cut in two any record for close skimming that any other machine can possibly make even under the most favorable conditions. Its Tubular quantity. Try it.

The Saving You Effect
IS great, is not half so hard to operate or clean as gravity appliances or other separators. No cream is wasted, no ice needed. Saves time to haul to the creamery. Skimmilk is in the best condition for feeding. Its Tubular economy. Try it.



The Butter You Make
IS easier churned, superior in quality, cleaner, sweeter, untainted by gravity processes or "Discy flavor" from the hard to clean cones, discs, or vanes found in all other separators, keeps better and brings higher prices. Its Tubular quality. Try it.

The Profit You Net
IS increased by getting more cream, stopping the ice bill, saving half the labor, making fewer trips to creamery, getting more for cream or butter, raising better calves, pigs and poultry at less cost. Its Tubular efficiency. Try it.

The Dairy Farmer as an Example of Prosperity.

[FRANK W. HOARD, Business Manager of HOARD'S DAIRYMAN, in *Agricultural Advertising*.]

"Let me say first, that the dairy farmer is the most successful and, as a class, the most progressive farmer in the country. I realize that some will say that this statement is too sweeping, but I believe it is only just and fair to say it, and anyone who will closely analyze agricultural work and agricultural people will accept the statement without discount.

"In saying this I am drawing a distinction between the farmer who keeps a few cows and the farmer who makes dairying the business of the farm. I mean those who are running a dairy of from 15 to 100 cows. To do one's own judgment justice, the fact should be considered that a well equipped dairy farm carries in personal property alone often from five to ten thousand dollars, and the property interest, together with the gumption that accumulates it, is a pretty fair guaranty that the dairyman is a business man on the farm. He is a farmer that is doing things. He is not dreaming his way to prosperity.

"It seems to me that there could be nothing plainer to fair reasoning than that the man in dairying is progressive and far above the average in intelligence. He is forced to deal with animal life along broad and liberal lines of thinking, and to be successful he must be on a higher plane of thought and work than can be accorded the man that simply farms because he seems unfit for anything else, and farms in the easiest way, mentally. It is true that all progressive farmers are not in dairying.

"There are a good many reasons why a dairyman is successful, that are, in a sense, merely the result of his being a brainy farmer. The dairyman is what you might call an intense farmer. He gets more dollars out of the same acres, and one reason for this is that by the constant and liberal fertilizing that dairying permits, his land is constantly growing towards its highest point of production. He feeds the products of his farm instead of carting them off to the warehouse. He is not simply a producer of raw material, but a manufacturer of a finished product. He is not idle from harvest to seeding, but business is going on winter and summer ever at the "old stand." He is making money, and it means more or better cattle, larger barns and a better home. He is not going without, or going in debt if he buys the improvements that are suggested by progressive farm management, neither is he going without the comforts of home that progressive men want. He is prosperous and lives and runs his business just as prosperous men in other lines live and manage their business. He belongs with those men who succeed in this world by doing with things, not without things. He is a man big enough to see that $100 or $200 for a good sire in his herd is good business. He is broad enough to know that wise expenditure can be economy.

"I believe he is one of the best for agricultural advertisers, because he is a farmer that is looking for the best. He is listening for the argument of quality—that's what he is continually being schooled in. There is no work on the farm that punishes so severely for ignorance or poor judgment, as dairying. Unwise and haphazard breeding ruins the dairy herd; poor feed, or wrong kind of feed, or indifferent feeding, means heavy loss in milk. Carelessness anywhere in handling the product, makes great loss; in fact, everywhere in dairying, the reward of success comes only with the exercise of thorough, intelligent work.

"He is the cash buyer and buys just as cash buyers always do. He is influenced by advertising, first, because being an intelligent man and a close thinker, from a sense of self-protection, he reads only the best papers, whose advertising breeds confidence, not distrust; and, secondly, he is a man that wants the best things and knows that to have his judgment right he must study manufacturers and their goods. He is progressive enough to want to know the best ways, methods and devices. Indeed, he is a man that wants, and advertising always interests such a man.

"The up-to-dateness of these people is, I think, nicely illustrated in the fact that over 50 per cent of the subscribers to HOARD'S DAIRYMAN forward their subscriptions and carry on their correspondence with this office on their own

(Continued on page 603.)

To Clean Carpets.

If you have a carpet that looks dingy and you wish to restore it to its original freshness, make a stiff lather of Ivory Soap and warm water and scrub it, width by width, with the lather. Wipe with a clean damp sponge. Do not apply more water than necessary.

The vegetable oils of which Ivory Soap is made, and its purity, fit it for many special uses for which other soaps are unsafe and unsatisfactory.

A Grade Jersey Record.

Ed. Hoard's Dairyman:—Enclosed find report of my little dairy for past year. This includes all cows kept on the place except three, one bought and two two-year-olds; neither have finished their year yet.

Nos. 4 and 6 need special mention. No. 6 has given in the past four years 27,167.7 lbs. of milk containing 1,321.53 lbs. fat. Her best year was 1901 when she gave 7810.4 lbs. of milk, containing 401.73 lbs. fat.

No. 4 gave in the same time, 24,105 lbs. of milk containing 1,248.56 lbs. fat. Her best year was also 1901, when she gave 6,900.8 lbs. milk, containing 375.41 lbs. of fat,

Both of these cows are half blood Jerseys. Have been tested from seven to ten times a year, the sample made up each time from six milkings. Following is the record of my herd:

NUMBER.	Age.	Lbs. of milk.	Lbs. of fat.	Cost of feed.
2	4	5926.3	283.45	$31.00
3	4	5631.1	260.39	31.63
4	8	6069.2	315.55	29.36
5	7	5774.7	274.99	28.00
6	7	6803.5	327.03	27.53

Average net profit..... $ 42.06

Kankakee, Ill. M. L. S.

Mr. Wheaton's Canadian Dairy Notes.

A New Method of Marketing Dairy Products—The Nova Scotia Travelling Dairy—The Season's Cheese Make—Crop Outlook—Canadian Fairs.

Ed. Hoard's Dairyman:—The members of the Ottawa Dairy Board of Trade have inaugurated a new feature in the marketing and selling of cheese that may not be without interest to the cheese fraternity of Canada.

For sometime the factories represented on the Ottawa Board have objected to selling cheese subject to Montreal inspection. They claim that after the cheese leaves the factories they are at the mercy of the buyer, who can, if he wishes, find some imaginary fault with the quality and put in a claim for a reduction in the price agreed upon before the goods were shipped. One or two instances of this kind are reported this season, and the factorymen at a meeting recently held, adopted a new method by which they will retain control of their output until the cash is paid over.

The plan is this: The factories having cheese for sale, are to ship it into cold storage in Ottawa on the day previous to that upon which the market is held. On market day the cheese will be inspected by the buyers, and when sold, will become the property of the purchaser only when he has paid over to the salesman the full amount of the sale.

This plan has not been working sufficiently long to enable one to judge how it is going to work out. The railways have agreed to an arrangement of rates by which the total freight charges will be little, if any, higher than if shipped direct from the factories to Montreal, and it looks as if the scheme would work out very well. It will depend largely upon the promptness of factorymen in shipping out their cheese and the willingness of the buyers to submit to this new order of things. Should the buyers unite and organize a boycott of the Ottawa market, the factorymen would have no other course than to return to the old way.

This new plan, however, has much to commend it to both buyer and salesmen alike. To have all the cheese in a district brought to one point for inspection, should effect a large saving in the buyers' expense account. In many districts also, the curing rooms are not what they should be, and the quality of the cheese might be very much improved, if put into cold storage a couple of weeks after it is made. Many a well made cheese has been spoiled by being kept too long in some badly ventilated and over-warm curing room. Such conditions could be overcome by factories shipping out regularly every two weeks, to some central cold storage, where the cheese could be kept in good condition until sold.

The factories supplying cheese to the government cool curing rooms had this feature pretty well demonstrated in 1902. So pleased were they with the arrangement that these rooms are filled almost to over-flowing, this year. It is an idea that could be worked out in connection with any cheese market, and might help solve some of the many difficulties connected with the buying and selling of cheese.

Though we have heard little of the old difficulties at the Cheese Boards, this season, there is no good reason for believing that they have not been settled to the satisfaction of all concerned. So long as the market is active and prices are good, things run along comparatively smooth. But let the market take a sudden drop, and some buyer rejects a lot of cheese, that would pass inspection on a rising market, and the trouble begins. This could be remedied by having the cheese brought to a central cold storage on market day, and the money paid over and the transaction closed as soon as the sale is made.

This movement of the Ottawa Dairy Board of Trade should, therefore, commend itself to the favorable consideration of factorymen all over the country. If worked out properly it should save both salesman and buyer much annoyance, and place the buying and selling of cheese, on a more stable basis.

For the past two seasons the Nova Scotia Government has operated a traveling dairy in that province. Miss Laura Rose, instructor in the home dairy at the Ontario Agricultural College has had charge of this work. The work has proven most satisfactory and this season two traveling dairies are in operation, one in charge of Miss Rose, and the other in charge of her sister. Nova Scotia farmers and their wives are thus receiving the best training in the management of the home dairy that Ontario can give. And from what we can learn of the quality of the dairy butter of that province, this instruction is badly needed.

There is room for a large development of the butter industry in that province. There are only 35 creameries and cheese factories in operation, and the total output of the creameries is only about $100,000 worth a year, which is not sufficient to supply the local markets.

The prospects for a large make of cheese and butter the balance of the season in Canada, are bright. Never, perhaps, in the history of Canadian dairying, have the pastures, taking the country as a whole, been better at this season. In Ontario especially, there is abundance of grass and little if any supplementary feed will be needed for some time. In eastern Ontario and extending through Quebec and into the Maritime Provinces, the severe drought of May and early June caused pastures to dry up considerably, forming a serious menace to the milk flow. But copious rains late in June and in July have improved matters wonderfully, and the outlook is most hopeful for a large make.

In Eastern Ontario and some parts of Quebec where the dairy is largely the mainstay of the farmer, a drouth leads to serious consequences. When a farmer cannot secure his usual return from the dairy, and the hogs kept in connection with it, he is in a bad way. The renewal of the pasture, therefore, means much in the districts referred to, and it is to be hoped the supply of succulent feed will continue.

In central and western Ontario, though dairying forms an important part of the farmer's operations in many districts, he follows a more varied system of farming and consequently is not so seriously affected when the grass supply fails.

The general crop outlook for Canada this year is most encouraging, while some localities are a little behind, not for many a year have the prospects for a good average yield been so bright. Especially is this true of Ontario, which will have a banner year. In Quebec and the Maritime Provinces a fair average yield of all cereals is expected. In the west the outlook is encouraging, though reports from Southern Manitoba indicate a big shortage in the wheat yield because of a severe drouth, which is largely local in character. In Western and Northern Manitoba, a good average yield is expected, while the territories will show up much better. The acreage under crop in the west has been largely increased this season, and the total output will probably largely exceed that of last year, which was a banner one.

A difficulty that is hampering farming operations in Ontario very much is the scarcity of farm help. In many sections enough help cannot be secured to do the necessary work of cultivating and cleaning the root crop. Farmers in some districts are reported to be plowing up turnips and similar crops, because they cannot get help to clean and cultivate them. This is rather a serious condition of affairs that will have to be remedied in some way if the best possible results from agricultural pursuits are to be realized.

The big annual fairs for which Canada is so much noted, will soon be here. The Winnipeg fair is under way this week and promises to be a success. At Toronto, will be held, from Aug. 27 to Sept. 13, a Dominion exhibition. For this exhibition, the Dominion government has made a grant of $50,000 to be given in prizes and in equalizing freight rates from the outlying provinces. The outlook at present is that this exhibition will be one of the greatest of its kind ever held on this continent. New buildings have been provided and many new features added. The display of live stock and agricultural products will be exceptionally large and if the people of the United States wish to see gathered at one point the very best thatCanada can produce, they should visit Toronto early in September.

Toronto, Canada. J. W. Wheaton.

GRADE JERSEYS.

Property of M. L. Shuffler, Kankakee, Ill.

University of Wisconsin College of Agriculture.

Ed. Hoard's Dairyman:—The coming term of the Short Course in Agriculture, which begins Monday, November 30th, and closes March 5th, promises to surpass all previous terms in attendance and character of the work outlined. Applications for registration are coming in rapidly; no less than one hundred and fifty are already enrolled in the first and second year classes.

The erection of the new Agricultural building with all modern conveniences and the additional instructional facilities added this year will materially strengthen the work in the Short Course.

Young men desiring to take the course should register in advance, in order to be assured that a place in the classes will be retained for them. Students are accepted in the order of their applications. No entrance examinations required and no tuition charged to residents in Wisconsin.

The new circular, describing the Short Course in Agriculture, is now ready for distribution and can be obtained by sending request to R. A. Moore,
Madison, Wisconsin.

Timothy Seed Wanted.

The Cornell Agricultural Experiment Station desires to secure samples of ripened heads of timothy from as many different sources as possible. It is the purpose of this Experiment Station to enter upon the breeding of timothy on an extended scale. It invites farmers having good fields of timothy to send heads which represent fairly the best of their fields. Freak heads, or heads from plants grown under unusual conditions, are not wanted.

Drop half a dozen heads, more or less, in an envelope, mark thereon plainly the name and address of the sender, and mail to Cornell College of Agriculture, Ithaca, N. Y.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own ight who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

WORLD'S FAIR SCORE CARD FOR BUTTER.

The management of the Dairy Department of the Louisiana Purchase Exposition have adopted the following scale of points for scoring the butter made on the exposition grounds, from the milk of cows entered in the competition for determining the capacity of the different breeds as dairy animals.

Flavor	30
Aroma	15
Grain	25
Color	15
Salt	10
Package	5
Total	100

This is practically the same scale of points which was used at the World's Fair in Chicago and has been used by the different associations where butter has been entered for competition, except that the 45 points heretofore allowed for flavor have been divided, 15 being given to aroma and only 30 to flavor proper.

Although this change was advocated by a good many persons prominent in dairy matters in the different states, it is a question with us whether it would not have been better for comparative purposes to have retained the old scale of points. Aroma and flavor are so closely related in butter that it is difficult, if not impossible, to separate them. In fact, there are those who contend that aroma is all there is to flavor. In other words, it is impossible to have good flavor without there is good aroma; and conversely, it is impossible to have good aroma unless there is also good flavor.

CONCERNING THE NUTRITIVE EFFECT OF SKIM MILK.

Wm. Porter Peck, writing in the *New York Times* on "Bad Food *versus* Longevity," makes this observation:

"If a baby, a puppy or a kitten be fed on milk that has been deprived of its cream it will for a time appear not to thrive, but after a while it will be healthy and vigorous and will continue so until the food is discontinued. Now, on the other hand, if the baby or young animal be fed on cream only, it will die of starvation as certainly, though not so quickly, as if fed nothing at all. If the milk be deprived of half of the normal percentage of any of its most important *mineral* contituents, there will be partial starvation, or a lessening of vitality, which is a condition favorable to the development of disease."

There are two important hints conveyed in the above statement which the dairy farmer should absorb and make use of. They accord thoroughly with our own observations in the feeding of skim milk:

(1) That the mineral and nitrogenous portions of the milk which create the brain, nerves, muscle, hair, skin and bones of the young animal are all contained in the skim milk. The cream contains the fat which produces only heat and stimulates to bodily action.

(2) That one of the most important considerations to be thought of when feeding this skim milk to these young things, is that it shall be pure, free from hurtful germs as much as possible, and that it shall be taken into their stomachs as near as can be at the same temperature and freshness that it comes from the mother.

If farmers would only work more thoroughly towards the last condition they would soon have a very much enlarged idea of the feeding value of skim milk.

WHAT IS THE VALUE OF SKIM MILK?

Three things chiefly govern in answering this question which is constantly being submitted to the DAIRYMAN.

(1) The condition of the skim milk, its freshness, sweetness and purity. We believe that skim milk from a centrifugal farm separator, fed sweet and fresh within an hour after it is separated, night and morning, is worth double in its feeding effect and value, what ordinary skim milk is worth, when separated either by deep setting, open setting, or the common skim milk of the creamery. In this connection it should not be forgotten that an important part of the nutritive value of milk as a food lies in its purity. Freshly separated skim milk is in its best form in this respect, if it is fed in clean vessels.

(2) The second important consideration that governs value, is the *age* and character of the animals it is fed to.

In hog feeding, for instance, it is important to feed skim milk to young pigs rather than old hogs, if the largest profit is expected. A pig weighing 50 to 100 pounds, will make nearly double the profit from skim milk that the same animal will when weighing 150 to 200 lbs. Here comes in also, the question of the kind of animals it is fed to. In our own experience we find the highest profit in feeding our skim milk, freshly separated on the farm, to registered and grade heifer calves. A likely, three-quarter-grade heifer calf at 8 months of age, will have consumed about 4,000 pounds of skim milk. With it should be fed, say 50 cents worth of blood meal, a dollar's worth of oats, and the same value in good hay or pasture. The returns in cash will be found considerably greater than if the milk is fed to pigs of the same value to start with.

(3) Now we come to the most important equation of all—the man who feeds it.

So much depends on the knowledge and understanding of the farmer. Has he made any special study of how to feed skim milk? Does he know that if fed to hogs in conjunction with some other food, say, middlings, corn meal, boiled potatoes, etc., that the value is greatly enhanced? This point was finely illustrated by an experiment made by C. P. Goodrich of this city. He found that a hundred pounds of good skim milk would make five pounds of pork when fed alone. Also that a bushel of shelled corn would make 10 pounds of pork when fed alone. But he found to his surprise that if the skim milk and corn meal were mixed and fed together, the gain from the union was *20 per cent.* Then, besides, there is an understanding of the value of cleanliness of pails and other feeding utensils. This is particularly important with calves. Many a calf has sickened and gone wrong because of the filthy condition of the feeding pail.

All these considerations are important if we get the last full profit out of our skim milk.

In Europe the farmers have a much higher idea of the feeding value of skim milk than is entertained by the farmers of the United States. The Belgian farmers fix the value of this important food at 33 cents per 100 pounds. But this value is attained by the fact that the Belgian farmers are thoroughly well posted in the art of feeding and developing young animals. This is a great consideration. Not long since a very successful dairy farmer said to us:

"The more I study this business of dairying the stronger is my conviction that the key-note to the whole question lies in developing the calf. If a man goes wrong there he is apt to be wrong most everywhere."

There is a world of truth in that statement and it is easy to see what a bearing it has on the profit a man gets from his skim milk.

THE FARM SEPARATOR.

Bro. Monrad, of the New York *Produce Review*, thinks there is danger in the farm seperator idea and says:

"Leaving all theories aside about what *can* be done, the fact remains that by removing the co-operative spirit, the local pride in our creamery, and the stimulating effect of personal contact with an ambitious, well posted butter maker we remove a potent factor in the production of the best butter."

We do not know what evidence, in *fact*, Bro. Monrad may have for his very positive assertion as to the ill effects of farm separators on the spirit of co-operation, but we can say from observation in this, Jefferson county, Wis. for 30 years, that the creamery idea has evils of its own. We have spoken of this before. The evil is that creamery patrons are very apt to lose their sense of personal responsibility. They do not see clearly that the quality and condition of *their* milk is an important factor in the making of good butter at the creamery. The creamery stands between them and the very useful market education that every dairy farmer needs.

We must see clearly the *effect* of our own actions on our fortunes, if we learn well what to do. Let us state facts. In 1874 there were a thousand and more farmers in this county who were making butter in private dairies and shipping it on commission to Chicago and other markets every week. Our local paper published every week a long string of names of these farmers, giving the prices they received for their butter as shown by the account-sales they handed in. The commission merchant was telling the shipper every week of his mistakes, his carelessness, his neglect, all of which told on the price he got for his butter. Every farmer was interested in educating himself to be a first class dairyman. They were anxious to read and study on the art of keeping cows *rightly*, breeding good cows, and the making of fine butter.

But the introduction of the central creamery has changed the mental attitude of hundreds of these farmers. They have grown careless and indifferent. They no longer stand squarely responsible for what they do. The creamery has somehow lowered their standard of personal responsibility, personal education in the acquirement of dairy information. Some of them say this: "What is the use of my taking all this pains with my milk, cows or stables? My neighbors will not do the right thing any way and so we may as well all go together"

There is a less desire to read and keep well posted on dairy matters among these creamery patrons, than there was when they were individual butter makers. To that extent the influence of the creamery has been bad. The creamery owners did not care to go to the bother of trying to keep the patrons up to the mark, as long as they got nothing for it, so far as *they* could see.

Now, the question is, will not the introduction of the Farm Separator System force the patron to see more clearly his own responsibilities? Will it not compel him to note more carefully the effect of his carelessness, and indifference? He has a good deal more to do with the final result than he did before. He is a cream maker now, not a milk maker simply. It will be easier for him to see when the cream is in off conditton than it was with the milk. His failure to do his share of the combined work as it should be done, can be brought home to him more clearly. Under such conditions will he not learn better than before how to co-operate?

THE VALUE OF THE BALANCED RATION.

Taken as they run, probably not one in a hundred of the men in the country who keep cows and call themselves dairy farmers, believe a word in this talk of the balanced ration. They have heard it at conventions and farm institutes, and read it in HOARD'S DAIRYMAN, or some other paper, and in both cases they have turned away from the thought with steadfast skepticism.

What is known as the scientific idea of feeding cows is looked on with contempt by the average dairy farmers, and this state of things will last as long as this generation of "average" farmers live.

But very few of them ever become converted to the truth, as the patient men of science have found it. It is sufficient to prejudice a great many "cow men" at once if you mention the word "science".

But with the on coming boys on the farm, there is some hope. They have no prejudice against the man who has patiently investigated the feeding problem until he has learned something other men don't know and yet ought to know.

For instance, there is the balanced ration idea. It means simply feeding the cow with food of such kinds and balanced in such proportions each, to each, that she will make the most milk for the least cost. Last winter, during the very high prices of all cattle foods, when even timothy hay was selling in the Fort Atkinson market for $17 and $18 a ton, we had a talk down at the hay market with a dairy farmer who keeps 50 cows. He was buying timothy hay at about the same price he could buy bran. We suggested that timothy was not a very good milk food and that bran would balance up the ration a good deal better.

He turned on us suddenly and said: "Hoard, do you know that there are not 25 farmers in this county who believe a blamed word you say on this balanced ration business?" We inquired why they did not believe it? That it was believed and taught by men, for instance like Prof. Henry who had spent more time and real study in studying into the truth of this thing than all the farmers in Jefferson county. Why should they not look into the matter, not stand clear away from it and declare it don't exist. He said he *had* investigated it. "How have you investigated it?" we asked. "Why I have kept and fed cows for 20 years; don't you think I know something about cows and how to feed them?" was his answer. We replied that he had certainly had a good chance to know what he was about, but our faith had been a good deal shaken since we saw him buying timothy hay for nearly the same price he could buy bran for; that did not look as if he had read much or studied much into the relative value of timothy and bran.

Then he cooled down a little and we

asked him to take home a few hundred pounds of bran on his load of hay and try the cows, say for two weeks, one week on timothy, what they would fairly eat, and the next week two-thirds as many pounds of bran a day in place of the timothy. He could then say he had looked into the question, made an experiment, had investigated it as scientific men have to before they can say they know all about it.

He agreed to do it. His report was something like this: "Well I've tried the bran and timothy experiment as you wanted me to and I wouldn't have believed there was the difference between them as you said."

We then asked him if he didn't think it was worth while for a man keeping a dairy of cows to know something of the principles of feeding and the comparative value of feeds, so that he might save himself from buying timothy hay in place of bran? He smiled a faint smile and said he "guessed there was something in it." How many farmers there are who are like him, despising knowledge and the truth and paying twice as much for error.

Plan for Convenient and Substantial Barn Wanted To be Built of Lumber as Cheaply as Possible for 100 Cows. No Basement.

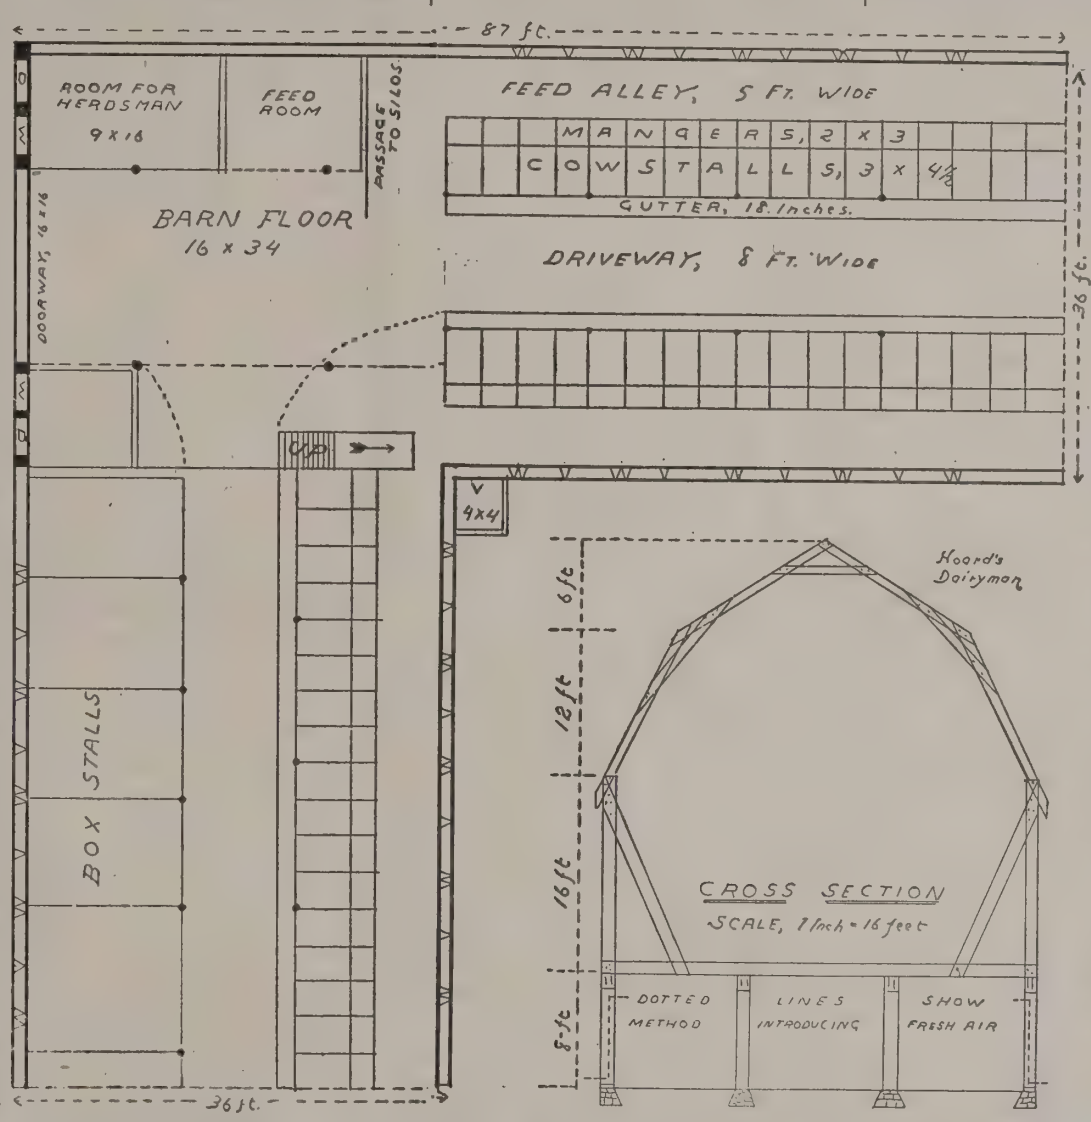
ED. HOARD'S DAIRYMAN:—I would like a plan for barn for 100 cows. We have a milk farm near this city and while we are now milking only 30 cows, I want to build sufficiently large for 100 cows. The building will be wholly on top of ground with no basement. It will be built of lumber and I wish to put it up as cheaply as possible and yet have it convenient and substantial. I want room for considerable fodder in loft. If you have not plans, can you refer me to some one who has a modern barn? I am a subscriber and some time ago saw a plan in the DAIRYMAN, but have misplaced the paper.

Hoping to see your representative here in October at the the Buttermakers' Convention, I am, yours, B. H. Lien.

Sioux Falls, So. Dak.

The futility of ready made plans is pretty well exemplified in the foregoing communication. It will seldom happen that another man will have occasion to build a barn like the one for which a plan is sought as above. A barn to accomomodate one hundred cows is necessarily a large structure, so large that very few farmers need so much room, and most of those who do, instead of asking for a barn that can be cheaply constructed, will be more concerned to find opportunities for expending, rather than saving, money.

We regret that our correspondent did not call for an economoical barn as well as for one convenient and substantial. There is perhaps no greater mistake made by dairymen in constructing barns than a disregard of true economy. In fact, it is a common error to confound economy with withholding expenses Many times, true economy is subserved by increasing expenditure.



It is always and everywhere economical, in planning for the care of cows, to make their comfort and health the first consideration. In the latitude of Sioux Falls, warmth and ventilation, are indispensable requisites in a stable for dairy cows but warmth and ventilation cannot be secured without the expenditure of more money than would be required to build a mere shell. Therefore, in the plans and suggestions which follow, we have had more regard for true economy than for mere cheapness.

This barn is to be situated on level ground and the whole structure is to be above the surface. Therefore, one of the first questions to be decided is whether a long, steep drive-way and bridge shall be constructed for delivering hay and grain into the second story, or shall provision be made for driving in on a level and elevating the hay and distributing it with the hay fork, operated by power. We have adopted the latter plan in the illustrations which follow.

If possible, this barn should be located so as to face north and west, thus giving opportunity for a yard sheltered from the north and west winds. Thus located, we suggest a driveway in the northwest corner. We have located the doors opening to the west, but if more convenient, the barn floor could be turned quarter round and the doors opened to the north without disturbing the general arrangement.

Not to over-burden our columns, in the sketch submitted, provision is made for only 48 cows, but it is one of the advantages for this style of barn, that the stables may be extended both to the east and to the south to accomodate any number of cows without at all interfering with the general arrangement or convenience.

The plan, as drawn, shows the interior width of the stables to be 34 feet, which allows a feeding alley on either side 5 ft. wide. If it was not contemplated to extend these stables in the future, the width of these alleys might be reduced to 4 ft., but where the length of the stable is to be 100 feet or more, a wider alley will be found enough more convenient to justify the additional expense. The stalls shown

in the plan are 3 feet wide. This affords sufficient room for medium sized cows, but if cows weigh 1,000 pounds or more, stalls should be from 3 to 6 inches wider. No matter what kind of tie or fastening is adopted, there should be partitions so that each cow may have a stall. This not only serves to promote the comfort of the individual cow, but prevents her from stepping upon or injuring her neighbor on either side. As will be seen from the cut, we devote one entire side of one wing to box stalls. This, probably, will appear to most people studying the plan as an unnecessary provision, but in practice, it will be found none too much. In the first place, accomodations must be found for two or more bulls. They should have quarters in proximity to the balance of the herd and not set away in some isolated and dark corner. In a stable for 48 cows, there should be not less than three comfortable box stalls for cows about to freshen, and what room, if any, remains, will be none too much for the young calves.

The cross section of one of these wings, as shown in the illustration, is our suggestion in regard to the construction of this barn, Abundant room for storage of hay and fodder is provided, and it is believed, that the plan suggested, combines the greatest strength and least cost. The first story, or stable part of the structure, is to be built by itself, the same as the walls are built. First construct a low foundation wall just sufficient to bring the timber part of the structure well above the surface of the ground and lay on this for sills, two thicknesses of 2 x 8 plank. On these sills set 2 x 8 studding 16 inches on centers and on top of these, two thicknesses of 2 x 8 to carry the joists for the upper floor. Set posts, as shown on the floor plan, to support the girders running through the center, on either side of the central driveway. Make these girders of 2x 12 lumber securely nailed together, breaking joints. If of full thickness, our judgment is, that three of these plank will afford sufficient strength, as they will make a timber 6 inches wide by 12 in. deep, and carrying strength is more dependent on depth than width of girder. The superstructure may be made of 2 x 6 studding, set like the joists 16 inches on centers, and braced, or rather tied, as shown, every 12 feet, where the studding and joists should be doubled, the tie running between them. Where the rafters join to make the curb roof, a brace is nailed across as shown, and at the top, a collar-beam. This form of roof not only adds greatly to the storage capacity of the structure, but it adds much to its strength. It is in fact largely a self-supporting arch.

Observe that provision is made in the walls of the first story, or stable, for the introduction of fresh air, by having an opening outwardly, at or near the ground, passing up between the studding and opening in the stable at the ceiling. The entire structure should be sheathed on the outside, with boards running diagonally across the studs and connecting and tying the upper story and the lower one. Over this, for the stable, place best quality of building paper, and cover the whole with such form of siding as the owner may prefer. The interior of the stable, both sides and ceiling, should be covered with a good quality of matched flooring, so that practically no air can enter the the stable, except as it comes through the ventilating flues. The location of these flues, as well as of windows, is indicated on the walls of the ground plan, by the letters v and w. The inlets for fresh air should be covered with wire netting on the outside and provided with slides on the inside, so that the amount of air admitted, may be regulated as the occasion demands. Use good sized windows, remembering that it is practically impossible to admit too much light in a stable.

The only remaining feature to which it seems necessary to call especial attention, is the large ventilating flue, or shaft, located in the angle where the wings come together. Make this of the size shown. Make large openings at the bottom, on either side into the stable, and also just under the ceiling, with gates or slides to close or open at will. This shaft should be practically air tight, throughout its entire length, and reach up well above the ridge of the barn to insure a good draft.

With these explanations, it is believed the diagrams published will enable any competent workman to go on with the construction of such a building, and we are confident that when so constructed, it will prove to be convenient, substantial and economical.

Raising Corn Fodder.

ED. HOARD'S DAIRYMAN:—I note in your issue of July 17, an article on raising corn fodder. W. B. J. has about my idea, drawn from about the same experience. In the same issue, page 538, we have another opinion, right to the opposite, from W. B. J. Now what is the new beginner to think, and who is he to follow? Now this is the reason of this article.

Many men after being fairly successful with some crop, rush into print, feeling sure that their way is the only one, when perhaps the next time he tries the same thing, it is a failure. W. J. B. took the intelligent way to find out why his cows rejected the corn butts and was not satisfied, after being repeatedly told by the Experiment Stations, that there was greater feeding value below the ear than above it. From my own experience, I find a stalk of corn can be pretty nearly divided in three parts, the top to the ear, the butt from the ear down, and the ear, then comes palatableness. When we sit down to our own meals, as a rule we leave the most palatable food to the last that we may be induced to take more food.

We should aim to have the cow eat the whole stalk and there is but one way to do that, and that is to have it all alike, and there is but one way to do, that is, to feed when in the right condition or put in the silo in the right condition, and where all are mixed together, according to my experience, one has the cheapest and most palatable milk-producing food obtainable. While in a time of short feed for both horses and cattle W. F. McSparran's method might be profitable, but I would not want to follow his plan except as a catch crop and then expect to get one of little value, but better than a short supply, or none at all.

Now, the real value of our agricultural press to some men, leaves others in doubt, and I have found it best to always go slow. Perhaps what may appear to some farmers to be of value to them, I could see no profit in my situation. I

Pennsylvania Pickings.

The Cow Trade.

ED. HOARD'S DAIRYMAN:—There is I believe no better large butter market in this country than Philadelphia, and one would think we in the south-eastern part of the state would be the very past masters of all that is good and modern in progressive dairying. But such is not the case. It is easy to be "nearest the church, the farthest from grace."

It is true, we have some fine dairies where we have such a multitude of them. We have some good cows among the thousands we own. We are able to make a living off our farms and herds and as that may be more than many of us think we deserve, our toleration of poor cows and poor methods may be accounted for. We are educated and intelligent, we have schools and churches, and are generally regarded as prosperous. We never get out of work nor the common run of us out of debt. We read—somewhat. The daily paper is in evidence everywhere. We have plenty of magazines and papers of literature, fashion and home-making, but when it comes to reading about our own business of farming, we draw the line at that. We know all the papers say of how the politicians are or are not farming us, but we will not be guilty of reading about our business.

Farming is too old a calling to have to drop into new ways. Of course, once a year, like the first of April, the farmer's institute comes around and we are gravely told after it has gone that seventy per cent of us have attended, and like Oliver Twist asked for more. Strange isn't it?—how inviolate figures maintain their veracity when so many ax-grinders juggle with them!

But cows? we raise very few of the cows with which we are afflicted. I don't know who raised them guess they growed. We kept them constantly moving, by buying and selling. I attended a public sale of an assorted lot of these cows the other day and made some observations. There were some pretty good looking cows in the collection, but cow looks are deceptive, or why were good looking cows being sold? Many of them were poor representatives of a noble family, or families for all families and tribes contributed either to the collection or the individuals.

The best claim many of them had to life was in the calves they mothered for the making of good veal. It is interesting to note how frequently a good calf will sell a poor cow, and indeed when sales are plentiful the one calf often sells a number of poor cows.

At this sale a cow of the Holstein persuasion was brought to the hammer. The seller said, "Now, gentlemen, this is a fine Holstein and a great milker. The man from whom I bought her quit attending the creamery and intended to keep this cow for a family cow, but he found her milk would not make butter—now here's just the cow for you creamery men."

CREAMERIES.

Now, Mr. Editor, you would not think that after all these years of his neglect of us that the creamery shark would float into our midst. Well, that's another of your mistakes, Mr. Editor, for he is here. He has his proposition with him, the fish have bitten and the creamery is being built. His proposition as I can gather it after a diligent search, is, in the rough, that forty-six farmers each put up a hundred dollars and for it he will build, equip and put into operation a creamery outfit that will be a thing of beauty and an everlasting profit, and turn it over to the forty-six farmers aforesaid. It is guaranteed to pay an 8% dividend, 17 cents a hundred for skim milk and "more for butter than they have ever received."

One of the fishes who hadn't quite bitten yet, told me that the guaranty covered 31 cents for butter, also; and inas-much as the market quotation for butter at this time is 23 cents, the bait is attractive enough for almost any fish to bite at.

There are queer ideas abroad about the profits of creameries. They are usually entertained by fellows who are not in them or are only started in. In the DAIRYMAN of July 10, I have read, copied from another paper, a formula for getting a creamery. The usual $4500 was part of it and it was to be run co-operatively. The cost of the creamery and salary paid were not to exceed $4500.

There was no provision, that I found, how long this salary was to be paid out of this sum, but suppose it was till some stock holder who wanted to run things and was not allowed to do so would refuse to play and break up the game. It was promised, however, that if the business were rightly managed, it would pay for the creamery in a few years.

So, therefore, this creamery business must be a prodigiously remunerative one, that the manufacture of the product of 400 cows will pay salary, wages, repairs, taxes, insurance, 6% interest on a $4,500 plant, and in addition pay the entire cost in a few years. Verily, it is no wonder that the festive promoter can go out among the farmers and pull their nether limbs. W. F. MCSPARRAN.

Pa.

Treatment of Fractures in Cattle.

ED. HOARD'S DAIRYMAN:—Broken bones in cattle and horses are generally believed to be incurable, or not worth treatment, and among non-scientific horse owners, it is supposed that a broken bone will not unite, that equine nature is different from all others, and that a fracture will not in reality undergo those physiological processes which in other animals lead to repair.

Cases having come under my own observation lead me to offer a few remarks on the subject of fractures in the animals of the farm, under which description most of the domestic animals are included; and I would rather say animals on the farm, and not the horse doing town work, as the whole conditions are altered, and the fractures that the town practitioners may consider quite hopeless, and recommend immediate slaughter, may, on the farm, and under other conditions be worth treatment which may result in success.

It is with the impression strongly fixed in my mind that a great many animals are slaughtered unnecessarily, that I bring before my readers a subject so old, yet of ever-recurring interest, as there will always be fractures, and the more discriminating owners, will make the least sacrifices and incur only the minimu mof loss.

Twice in one day have heifers with broken limbs come under my observation, and would have been slaughtered, producing but a nominal sum from the butcher, who rarely makes the mistake of over estimating the value of an animal, the owner of which is compelled to sell; indeed, this attitude of the butcher or buyer is one of the reasons why treatment of fractures should be more often attempted in the case of farm stock.

Without entering into the technicalities of the different fractures, or using the language of the schools, I may point to a few situations, and to some kinds of fractures, which may be worth treatment. As previously stated, the conditions under which animals live are so widely different that a case one man might keep

"ADVERTISEMENT."

WAITED 30 YEARS

For the Proper Food.

A man who was a semi-invalid for 30 years got well in about a month when he found the right food. He says: "When I was 19 years of age I had a severe attack of typhoid fever, and after almost starving to death I was left in a pitiable condition.

"My nervous system was so shattered that I had to walk with a cane for six months after I got on my feet and my stomach was terribly distended. This was thirty years ago and since that time I have never known health although I had tried doctor after doctor, until six months ago I saw an article about Grape-Nuts that impressed me so I thought I would try it.

So I gave Grape-Nuts a trial, more as something to eat than with any idea it would help me. My improvement commenced immediately and has kept right up until now. I have used seven packages and I feel like another person. I am in better health than I have been since boyhood and am strong and contented. Grape-Nuts food helped me after everything else failed and I look on this as an evidence of the great power of proper food." Name given by Postum Co., Battle Creek, Mich.

Send to the Co. for particulars by mail of extension of time on the $7,500.00 cooks contest for 735 money prizes.

THE U. S EXCELS ON ANY TEMPERATURE.

Our "would-be competitors" the DeLaval Separator Co., finding themselves badly beaten in the six weeks' tests of six different makes of Separators at the Kansas Agricultural College, as shown by the official Bulletin No. 123 issued May 26, 1903, in their efforts to break the force of so disastrous a defeat, have compiled a Bulletin of their own "getting up" purporting to be signed by several students, in which they try to make it appear that the DeLaval was not terribly beaten, as the Official Bulletin shows it was as follows:

Average test of skimmilk of DeLaval Separator .048
" " " U. S. " .033
U. S. excels DeLaval .015

Showing that the DeLaval Separator left 45 per cent. more butter fat in the skimmed milk than the United States.

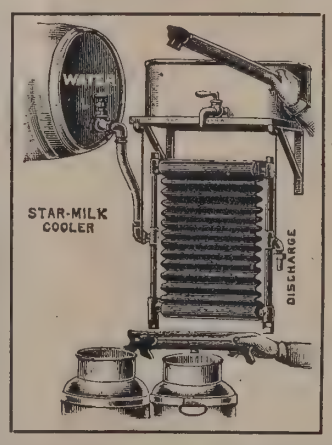
Again in this "gotten up" Bulletin, our "would-be competitors" state that the U. S. Separator "choked up" on 39 lbs. of milk at 70 degrees of temperature and that the DeLaval ran 80 lbs. Every dairyman using a U. S. Separator knows that the U. S. will not "choke up" on 80 lbs. of good milk at 70 degrees, and that such statements are made in an attempt to break the rapidly gaining popularity of the

U. S. SEPARATOR.

We make the following proposition to any dairyman wishing to buy a separator, viz.: We will put a U. S. Separator into his dairy and agree that it will not "choke up" on 80 lbs. or twice 80 lbs. of milk in good condition at 70 degrees, provided he will pay for the separator if it does not "choke up."

The best authorities do not advocate separating at 70 degrees, but if Dairymen prefer to, the U. S. will do it when properly adjusted.

The U. S. Separator skims cleaner than any other separator on the market at any temperature from 70 degrees to 156 degrees at proper adjustment. The Official Bulletin No. 123 of Kansas Agricultural College, dated May 26, 1903, states that



The U. S. Excelled all Others in tests of Skimmed Milk and in Minimum Total Loss.

THE U. S. SEPARATOR HOLDS WORLD'S RECORD.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

WHEN YOU SEND IN YOUR RENEWAL, SPEAK TO A FEW OF YOUR NEIGHBORS AND HAVE THEM JOIN YOU. CLUB RATES: 2 Subscriptions, $1.50; 3 Subscriptions, $2.00; 4 Subscriptions, $2.50; 5 Subscriptions, $3.00.

Are You in the Market for a Milk Cooler?

If so, why not purchase the Star?

Can be used with water at an elevation, or with water below level of cooler.

Will cool cream as well as milk; can be used with any size or style separator..

Is constructed of copper, tinned on the outside. Will last a lifetime.

There is no agitation required of either water or milk.

Send for Cooler Booklet which will give you the list prices and capacities of our full line of Milk and Cream Coolers.

STAR MILK COOLER CO., Haddonfield, N. J.

High and Low.

High in excellence, low in price;
High in popularity, low in stature;
High in saving powers, low in cost to operate—the

Champion Milk Cooler-Aerator

and treat successfully would entail a heavy loss on another.

The horse, while having the greatest value, is the worst subject for treatment, and for several reasons. He is not a good patient, he does not remain in a recumbent attitude long enough together, as does the ruminating animal; he does not get up and down on three legs so well as a bullock, sheep or pig; and if the fracture be on a hind extremity the wasting of the abdomen is so great that he becomes a wreck.

Again, owners are not satisfied like surgeons to the humans, to see the patients out again with the assistance of crutches, or a walking stick, nor can he congratulate him on being only a little lame. It is necessary that the horse should be as sound as before the accident and as capable of labor, and here we have a difficulty that does not apply to the ox, pig, sheep, or even dog, since the latter can do a good deal of work on three legs.

In all cases of fracture or dislocation, the services of a veterinary surgeon should be obtained if possible; but in some places these are unattainable, and there are cases where the animal is not of sufficient value to requisition a professional man from a distance of some miles.

It is surprising, in these days of technical education, how very few of the farming class recognize the bones of animals, or have the least idea of their position—such ignorance is now inexcusable.

In offering advice to my readers, it is assumed that they have a general idea of the outlines of anatomy, and know the relative position of the different bones, which will enable them to judge of what bone is broken, and to discriminate between a fracture and a dislocation. It may be taken as a broad rule, that in a fracture there will be elongation of the limb, and in dislocation, shortening of it, while the deformity resulting will depend greatly upon the seat of the injury.

A fractured bone that is well covered with muscle, and having the broken ends in apposition, is a hopeful one. Many simple fractures of the humerus or armbone, and of others of the "long round" class, will unite well enough in the case of animals other than the horse, or in such as are not destined for labor. It will not be worth while to treat a fat or forward in flesh bullock for such an accident, but a youngster or poor "store" of no value to slaughter, will often make a fair beast, if given time. Bones such as the humerus, femur, etc., are not in a position to be benefitted by splints or surgical appliances, but the old fashioned plan of applying either a blister or charge is not without its advantages.

Taking the case of the humerus (shoulder) for instance, the swelling caused by a blister, produces for a time, the equivalent of a pad between the skin and the seat of the fracture, and the additional soreness induces the patient the more quickly to take care of it. Herein, individuals differ greatly. One will from the first exercise the greatest care in getting up and down, while another will be always getting into trouble, and causing fresh injury to retard the process of reunion.

I have said many bones will unite "well enough," by which it should be understood that they will be restored sufficiently to enable the bullock or the pig to feed, or be fatted for the butcher, or the cow or ewe, the sow or favorite bitch to be retained for breeding, although some deformity remains, which is not fatal to the animal's welfare.

If a long bone is broken into a joint, that is to say, in the direction of its length, and not transversely, it may not be worth treatment, as much fever and possibly suppuration of the joint may follow, nor will it be worth while, as a rule, to treat a fracture with wound, where the bone is either shattered into a number of fragments, and is protruding through the skin. There are breakages below the knee and hock, especially among young stock, that are very hopeful, if promptly taken in hand, and the injured limb put into such splints as can be obtained.

Nearly every amateur can be relied on to select splints sufficiently strong, and to make them secure enough, though he have nothing but a hedgerow, or the bark of a tree, from which to choose his appliances, but the fault he commonly commits, and which the trained surgeon avoids, is putting on anything that will cause damage, when the inevitable swelling follows. It is not sufficient that the broken ends of a bone he brought into apposition and the limb supported in its proper position, but the parts should first receive a padding of some compressible material that will minimize the risk of sores, and do away with the necessity of removing the splint too soon.

If the hedge surgeon (no offence meant) has no better material to choose, he may find a coat lining, or spare a sock, with which to build a foundation for his splints. As in the days of muzzle-loading guns, the inside of hats and caps and coats provided many a wad in cases of emergency, and leaves have been resorted to for the same purpose, and so they may be as surgical aids today. W. R. G.

Montreal, Can.

Ropy Milk.

Concerning this trouble which is caused by an outside germ which gets into the milk after it is drawn, Prof. Farrington recommends the following:

The best way to overcome this trouble is to carefully wash the cow's udder and brush her legs, afterwards drying both with a clean towel; then the milker should wash his hands, thoroughly steam the pail into which he milks, and after throwing away the first streams of milk drawn, milk the cow with dry hands into this clean pail. The milk should be protected as carefully as possible from dust and then strained into the cans, in which it is to be transported, or in which it is set for cream rising. The strainer cloth, carrying cans and separator, if one is used, should be given an extra washing and scalding in order to destroy any of these germs, which have been the cause of the ropy milk. There is no doubt that this trouble may be overcome in this way, and the success one has in doing it will depend entirely on how carefully he protects the milk from the germs, which must get into the milk after it is drawn from the cow.

THE LARGEST HAND SEPARATOR CREAMERY WEST OF CHICAGO.

It is asserted that the co-operative creamery at West Salem, Wis., is the largest creamery west of Chicago using farm separators, measuring by the amount of daily, weekly, monthly and yearly output of butter. The following figures are of interest:

In one day it has turned out 5,760 lbs. butter; in two days, 9,760 lbs. From Jan. 1, 1902 to July 1, 1902, 6 months, it made 402,627 lbs. butter. From Jan. 1, 1903 to July 1, 1903, the amount made was 467,905 lbs., a gain over last year of 65,278 lbs. For the month of June, 1903 the output was 113,919 lbs.; the last week in June the make was 25,300 lbs. Nearly every patron uses a farm separator and the cream is gathered in wagons.

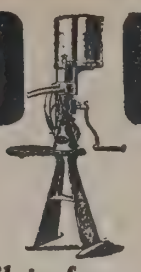
"ADVERTISEMENT."

CHANGE

Quit Coffee and Got Well.

A woman's coffee experience is interesting. "For two weeks at a time I have taken no food but skim milk, for solid food would ferment and cause such a pressure of gas and such distress that I could hardly breathe at times, also excrutiating pain and heart palpitation and all the time I was so nervous and restless.

From childhood up I had been a coffee and tea drinker, and for the past 20 years I have been trying different physicians but could only get temporary relief. Then I read an article telling how some one had been cured by leaving off coffee and drinking Postum and it seemed so pleasant just to read about good health I decided to try Postum in place of coffee.



I made the change from coffee to Postum and such a change there is in me that I don't feel like the same person. We all found Postum delicious and like it better than coffee. My health now is wonderfully good.

As soon as I made the shift from coffee to Postum I got better and now all of my troubles are gone. I am fleshy, my food assimilates, the pressure in the chest and palpitation are all gone, my bowels are regular, have no more stomach trouble and my headaches are gone. Remember I did not use medicines at all—just left off coffee and drank Postum steadily." Name given by Postum Co., Battle Creek, Mich.

Send to the Co. for particulars by mail of extension of time on the $7,500.00 cooks contest for 735 money prizes.

Empire Empire

Eight Years — Fifteen Cows

The Empire Way Makes Cows Pay.

1895 1896 1897 1898 1899 1900 1901 1902

How's This for a Record?

Emporia, Kans., Jan. 2nd, 1903.

Empire Cream Separator Co., Bloomfield, N. J.

Dear Sirs: Have used one of your **Empire** Cream Separators for the past eight years, during which time I have been milking at all times from twelve to fifteen cows. The cost for repairs in the eight years has been only seventy-five cents. I have had experience with other separators but consider the **Empire** superior to any other, as it never caused me any bother. It is easy to clean and has proven very durable. It does good work at all times. L. H. VAHSHOLTZ, Rural Route No. 4.

The Empire Cream Separator turns more easily, is more easily cleaned, does better work, and costs less for repairs than any other, because it is the **simplest separator made.** Don't buy a separator until you have investigated the merits of the Empire.

Send for our new book on Making Milch Cows Pay.

(Continued from page 589)

would suggest that every man be governed by his own environments and must try for himself to see what is of the most value to him. The year of 1903 is to be one of high cow feed, especially in the eastern states, and the great value of such papers as HOARD'S DAIRYMAN is not half appreciated.

Just think then, how much they are like a dairy separator. They must take the whole milk and give us the cream. Now, if this comes close to skim milk, why chuck it out and give us that that has a higher per cent of fat in it. Just one word more in regard to W. F. McSparran's article. I would like to ask, why should the offices for agriculture in Pennsylvania or any other state be controlled by politics? But such is a fact. But how are we to help it? The word politics sounds dirty to most farmers' ears, and I think it is about as it sounds, and while we are hustling about to secure our crops the politician is doing his work for another term, and the farmer like the under dog, that he is, must put up with the crumbs that fall to him, and be patted on the back by some institute speaker this winter and told what a noble calling his is. How is it when they ask for anything from their legislators? "O, you must wait until another year," or, "I will see what can be done," and next winter the same old institute speaker tells the same old story.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

Skim Milk for Poultry.

ED. HOARD'S DAIRYMAN:—Skim milk will yield larger returns if fed to chickens than if fed to hogs. Furthermore chickens are easier to care for and you get quicker returns.

Keep thoroughbred chickens, for they will lay better and bring a better price when taken to market. Keep a strict account with your poultry. If you doubt the above statement about the larger returns, it can be easily proven.

A CHICKEN CRANK.

Milwaukee, Wis.

Whitewash for Barn.

Will you please publish in your paper a good recipe for making whitewash for a dairy barn? I wish to apply whitewash with whitewashing machine.

L. D. W.

Greenwood, Ill.

A good whitewash can be made by slacking ½ bushel of lime in warm water and enough cold water to make it thin enough to spread well. Add to the mixture ½ peck of salt, and stir until dissolved. Strain through fine sieve. This can be put on with a brush or more quickly with a spray pump if the surface is rough. A Vermorel nozzel is often used to spread whitewash, with good results.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—President Newman called the meeting to order as usual, and the minutes of July 27 were read and approved.

The Quotation Committee reported 18½c firm as the official price. No sales nor offerings.

Elgin, Ill., Aug. 1, '03.

DAIRY MARKETS.

ELGIN, Ill., Aug. 3—Butter ruled firm on the Board of Trade to-day, selling at 18¼c a pound. Sales for the week were 798,4 0 lbs.

CHICAGO, Ill., Aug. 3—Butter—Extras, per lb. 18½c; firsts, 16½@17½c; seconds, 14@15½c; dairies, 12½@17c; process butter, 16½c; packing stock, 10@12c; ladles, 14c.

Eggs—prime firsts, at mark, cases included, 16c; miscellaneous receipts, at mark, cases returned, 10@10½c; at mark, cases included, 10½@12½c; fresh gathered extras, 18c.

Cheese—Twins, per lb., 10@10½c; Longhorns, 1.@11½c; Daisies, new, 11@11¾c; Swiss, 11@11½c; Young Americas, new, 11@11¾c; Brick, 9c.

Cattle—All grades of cattle met with a good demand and prices ruled strong to 10c higher, with the advanced mostly on finished steers of all weights Three lots or five loads averaging 1,197 @1,593 lbs. sold at $5.65, being as high as any cattle have sold here in over three montds. Fourteen loads averaging 1,393@1,521 lbs. sold at $5.60, with a good many at $5.35@5.50. Most of the 1,150@1,350 lb. steers sold at $4.80@5.30. Very few beef steers sold below 4.50, with a few as low as 3.70. Distilling steers sold at 5.25@5.40. About 2,500 grass westerns in rather poor flesh sold at 3.75@4 65 for steers and 2.75@3.75 for cows and heifers. Texas steers sold at 3.50@4.10. Native butchers and canning stock steady at last week's decline. Stockers and feeders sold at 2.25@4,25.

Hogs—The general hog market was active and mostly 5c higher than Saturday's closing. Both packers and shippers bought freely, and everything sold from first hands. Receipts about reached expectations, being estimated early at 35,000 and later at 32.000. The quality was better than the close of last week, yet only fair for Monday. The average weight was heavy again, and last week's average was the heaviest since last September, or 242 lbs. Some light sold at 5.70, with best 210 lb. butchers at 5.50 and choice 260 lbs, averages at 5.40. The average cost price for the day was 5.13.

PLYMOUTH Wis., July 28—Cheese—21 factories offered 2,822 boxes, of which 83 Americas were passed on. The balance sold as follows: 432 Longhorns at 11⅜c; 50 Longhorns at 11¼c; 1,138 Daisies at 10¾c; 381 Daisies, 10⅞c; 82 Twins at 10¼c; 151 Twins at 10⅜c; 448 Americas at 11¼c; 57 Americas at 11⅜c. Market active and firm.

MUSCODA, Wis., July 25—Cheese—Sales today were 50 Twins at 10¼c, and 129 at 10½c.

SEYMOUR, Wis., July 28—Cheese—The sales to-day were: 219 Twins at 10½c; 4 at 10c; 65 double Daisies at 10⅜c, and 708 at 10¼c.

BRILLION, Wis., July 23.—Sales today were: 435 Twins at 10¼c, 20 at 10⅜c, 425 Daisies, at 10⅞c 619 at 10¾c, 50 cases Young Americas, at 11c, and 132 Cheddars at 10¼c.

HORTONVILLE, Wis., July 23.—Cheese—The offerings on the call board today were all sold as follows: 49 Cheddars at 10⅜c; and 56 double Daisies at 10½c, and 725 Twins at 10⅜c. Market active. Next meeting will be held Thursday Aug. 6.

SHEBOYGAN FALLS, Wis., July 29—Cheese—Seventeen factories offered 1,763 boxes of cheese on the Call Board today. 35 cases Longhorns were withdrawn; balance sold as follows: 73 cases Young Americas at 11¾c, 533 at 11¼c; 351 Daisies at 10⅞c; 38 at 10¾c; 134 cases Longhorns at 11⅝c; 124 at 11½c; 176 at 11⅜c. Market steady and firm. The eight offerings indicate a large falling off in the flow of milk.

SHEBOYGAN, Wis., July 29—Cheese—The offerings on the Sheboygan Dairy Board to-day were 1,719 boxes, of which 101 were passed. The sales were: 42 Twins at 10¼c; 545 Daisies at 10¾c; 75 Longhorns at 11½c; 45 at 11¼c; 445 at 11⅜c; 181 Young Americas at 11¼c; 277 at 11⅛c. Market was firm.

MANITOWOC, Wis., July 29— Cheese —Sales on the Cheese Board today were: 200 boxes Twins at 10c; 800 Young Americas at 11c; 1,700 Daisies at 10¼c.

MARSHFIELD, Wis., July 24—Cheese—Ten factories offered 735 boxes of cheese and all sold as follows: 447 Twins at 10½c, 235 Daisies at 10⅝c, and 20 double Daisies at 10¼c.

APPLETON, Wis., July 23—Cheese—Eighteen factories offered 1,029 boxes of cheese and all sold as follows: 59 Cheddars at 10½c, 148 at 10⅜c, 172 Twins at 10½c, and 650 at 10⅜c.

Latest quotations for fancy creamery:—New Orleans. 19½c; Baltimore, 19½@20c; Cincinnati, 20½c; Buffalo, 19c; St. Paul, 18c; Minneapolis, 18c; Milwaukee, 18½c.

NEW ORLEANS, La., Aug. 3—Butter—Extras, 19½c; ladles, 15c.

Eggs—16c; fair demand.

NEWARK, N. J., Aug. 3—Butter — Market steady at 19c.

Eggs—19c for extras.

LIVERPOOL, Aug. 3 —Butter—Good United States steady, 75s.

Cheese—American finest, white 45s. 6d; colored, 47s.

CONSIDERING the cost of labor, of applying it, and its great covering capacity, Pure White Lead is not only the cheapest Paint in the first cost, but because of its extreme durability is by far the cheapest in the end.

Furthermore, no scraping or burning will be required when repainting becomes necessary.

If interested in paint or painting, address,

National Lead Co., 100 William Street, New York.

SAVES ITS COST ON THE FIRST CROP.

It spreads all kinds of manure, lime, salt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.

Do you know of any other piece of machinery for use on the farm of which this can be truly said?

The Improved **Kemp Manure Spreader**

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new **Beater-Freeing Device, Apron-Returning Device** and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about **"How to Grow Big Crops."** Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court. **KEMP & BURPEE MFG. CO., BOX 46, SYRACUSE, N. Y.**

ROBBER COWS.

Some cows rob the owner of the feed they eat, and of the profit of the rest of the herd. They have little or no butter fat in their milk. Find them out and send them to the block.

UTICA, N. Y., July 29—The sales today were as follows: Eighty-four lots, 6,941 boxes.
Ruling on large and general, 9¼c; ruling on small, 9½c. Butter 24 pks. at 20½c, 33 at 21c, 700 1-lb. prints at 22c. Cnrb sales 1,000 large at 9⅝c, 1,400 small at 9¾@9⅞c.

CANTON, N. Y., Aug. 3 —Cheese — Offered 2,369 boxes of cheese and 1,325 tubs of butter. Cheese sold at 9⅝c; butter at 19⅝c.

WATERTOWN, N. Y., Aug. 3—Cheese—Sales 7,000; 9¾@9¾c for large white; 9½@9¾c for large colored; 9¾@10c for small Singles and Twins.

BALTIMORE MARKET.

BALTIMORE, Md., July 30—Butter—While the general receipts continue liberal there is no increase in the receipts of extra creamery, but on the contrary the receipts of this grade are gradually growing lighter. Now that the prices have been hammered down to bed rock, there has been a very good demand prevailing so far this week both from speculators and the local jobbers. Hence, all attractive offerings have met ready sale. Stock that will grade strictly first has also been in good request, while the under grades are accumulating quite rapidly. Imitations—The supply is quite equal the demand, which is confined exclusively to fancy marks. Ladles—While in rather moderate receipt the supply is sufficient for the requirements. Packing Stock continues in ample supply. The demand is principally for fresh, sweet stock; defective stock is dull sale. Blocks and Prints are in quite liberal receipt; there is a wide range in values. The market at the close rules quite active and steady to firm on all desirable offerings, while off grades are dull and values uncertain.

Eggs—The receipts of strictly fresh full-bodied eggs have continued very light, and for this quality there is a quick demand at outside prices. While on the other hand a large proportion of our supply has been coming from central and southwestern sections and are showing more or less effects of the hot weather that has prevailed throughout those sections. The market at the close today rules firm on all choice to fancy offerings at 17½ cents. Be sure to grade and candle closely before shipping your eggs.
Cheese—The receipts are ample; demand irregular; market quiet, but very firm. Swiss—Our quotation are for new stock.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—One 30 inch French burr geared feed mill in best running order; also one Western Mill corn sheller, capacity from 5 to 75 bushels per hour, nearly new. Reason for selling, too large for this place. JOHN ZIEGLEY, Valley, Wis. 26-tf

Two choice young Guernsey bulls for sale. MRS. A. W. LEHMANN, Neosha, Dodge Co., Wis. 12-sp

Wanted—An experienced man competent to take entire charge of poultry and Collie departments upon a large stock farm. Splendid opportunity to grow into a permanent, responsible and remunerative position; state age, experience, references and salary expected. Address "STOCK FARM," care Hoard's Dairyman, Fort Atkinson, Wis. 26-2

Creamery For Sale—In section where the field for milk is good. Has from 8 to 10 thousand daily patronage. Plenty of power, good water, good machinery, two Springer separators. Will be sold for $1,600.00. A splendid opportunity for a good man. For further information address C. F. SWEET, Greenfield, Pa.

Young Man, for past 11½ years with the De Laval Separator Works, and quite competent of maintaining and repairing all styles of Alpha machines, is open for engagenents. PETERSON, Oak St., Poughkeepsie, N. Y.

Wanted—To rent with privilege of buying, a farm with established retail milk route within short distance of thriving town. JOHN F. FENTON, Fox Chase, Pa. 26-sp

Wanted—A man to take second place in butter factory. Must be steady and plain with figures. Address RINGWOOD BUTTER CO., Ringwood, Illinois. 26-4

For Rent—On or about Sept. 1, a dairy farm of 140 acres, located in southern Michigan, adjoining one of the most prosperous towns in State. Keep from 25 to 35 cows; milk sold from my wagon at wholesale and retail. A beautiful dwelling house of 12 rooms, basement barn 40×80, also other buildings, and a silo with a capacity of 100 tons. Will rent this farm to a responsible man either for cash or on shares. Address DAIRY FARM, care Hoard's Dairyman. 26 2

Wanted—An experienced butter maker to buy one-fourth or one-half interest in creamery and run the same in good location. Address T. G. FISHER, 48 W. 2d St., Fond du Lac, Wis. 26-3

Wanted—To correspond with a competent cheese maker. H. P. SHERWIN, Dixon, Mo.

Holstein Bull Calves—One thoroughbred, four high grade, 3 to 5 months old, all handsome, healthy, fine growers, the produce of my carefully selected dairy herd. For sale at reasonable prices. H. N. HILLS, Harcourt Farms, Gambier, Oh. 26-2

Wanted—A man who tharoughly understands the handling of dairy cows and the making of first class butter. Married man preferred who has help to milk. Address JOHN M. PARKER, Echo, Mont.

For Sale—Large English Berkshire boars of choicest breeding. JERRY VOSBURG, Neenah, Wis. R. F. D. No. 9. 26-4

For Sale—Holstein bull 3 years. His dam, Zanca De Kol A. R. O. 23½ lbs. She by De Kol 2d's Paul De Kol. Sire, Pauline Paul 2d's Count, grandson of Pauline Paul. Price $100.00. Also a few choice young cows and bull calves sired by him at overstocked prices. Address E. S. ROBINSON, Forestville, N. Y, R. D. No. 6.

For Sale—960 acres of land in the best dairy county of the great dairy state of South Dakota. 640 acres under fence. Good buildings, inexhaustable supply of pure water. $15.00 per acre. Would sell stocked or partly stocked with good grade Short horn cattle if desired. WELLS F. PIDGE owner. No agents. Highmore, Hyde Co., S. D.

Herdsman Wanted on 50 Cow Dairy—Good milker, unmarried, steady and to understand calf and hog feeding. IVAR JOHNSON, Fremont, Neb. 26 3

Herdsman Wanted—Single man not under 30 years of age, with several years experience; one acquainted with rearing and caring for Holsteins. References required. State wages required including reference. Steady place for right party. Address D, care Hoard's Dairyman. 25-tf

Angelus Herd Guernseys—For Sale—Bull Calf, superior breeding; price $50.00. Address MARCH, 39th & Western, Los Angeles, Cal. 23-tf

For Sale—Dairy Farm, 576 acres, about 75 head well bred Jersey cows and heifers, herd in good condition, 1 mile from growing town of five thousand, dairy well established and paying handsomely. Chronic illness requires sale, though sacrificed. Great bargain. Write for particulars. MRS. M. R. CARTER, Gainesville, Florida. 23-4.

Herdsman Wanted—One familiar with care and feeding of Holstein-Friesians. Good references and experience required. Address F. W. ALLIS, Monona Farm, Madison, Wis. 23-4

Macon County, Missouri Farm For Sale.—80 acres good land, well fenced, plenty small fruits; two-story 8-room frame residence, front and rear stairs, large halls, cellar 16x32; barn 42x60 with 12x60 leanto. All in meadow and pasture. Residence within 100 yards of depot just outside corporate limits town of 600, 4 miles of coal mines two thousand miners. Place to start a creamery. Six are shipping cream 75 miles away. Price $75.00 per acre, one-third down balance 5%. Write for particulars. CHAS. H. MARMADUKE, Callao, Mo. 22-4

Stock and Dairy Farm For Sale—¼ mile from city limits. 171 acres with milk route and telephone connections. Will sell with or without stock and personal property. For full particulars address THEO. GLOECKLER, Portage, Wis. 24-tf

Are You Looking For Land?—We have it to sell; thousands of acres of fine land around Crandon, Wis., Forest Co. Hardwood land from which the saw-logs have been cut, but there are still many dollars' worth of good wood, bolts, pulp wood, etc., on every acre which goes with the land. Close to fine growing town, county seat. Good water, clay soil and near railroad. Prices and terms reasonable. Write me for maps and circular. Address L. T. CRABTREE, Crandon, Wis., Forest Co. 24-4

200 Acre Dairy Farm For Sale—1½ miles from town. 140 acres plowed. Good house, fair out-buildings, wind mill and tank, small fruit, lots of grass. Price $5,000; $3.000 cash, balance 4 years 6%. Also 25 milch cows on shares to buyer with separator. E. E. GOOD, Babcock, Wis. 24-4

For Sale—7 Scotch Collie pups; one 3 months, light Sable, some white, worth $10.00 each, will sell for $5.00. Holstein bull calves, one 8 months old, dam has A. R. O. of 475 lbs. milk and 19 lbs. 14 oz. butter in 7 days, $60 00 takes him. HENRY WALSH, Sheboygan Falls, Wis. 24-4

Choice Guernsey Bull Calves For Sale—or will exchange for one of equal breeding. E. M. FITZMAURICE, Berlin, Wis. 25-2

For Sale—A fine St. Lambert Bull Calf, choice breeding. J. G. HALDEMAN ESTATE, Thompsontown, Pa.

For Sale—Cheese factory in Northern Wis., 5,000 lbs. of milk in best of season, at a bargain if taken at once. Address G. R., care Hoard's Dairyman. 24-3.

For itinerary, illustrated folder and full particulars, apply to agents Chicago & North-Western R'y.

Meadow Fescue.

[Press Bulletin.]

Meadow fescue, *Festuca elatior pratensis*, usually known by the name of "English blue-grass" in Kansas, was introduced from Europe, but is now widely cultivated in the United States, and has become thoroughly naturalized, being found wild in some localities on the roadsides and in pastures and meadows. There seems to be no good reason for calling it "English blue-grass," other than that the grass is grown largely in England as a meadow and pasture grass, supplying, perhaps, in a measure in that country the use which the Kentucky blue-grass has in the United States. Meadow fescue is a tufted grass, more spreading in habit than orchard-grass, but not so rank and rapid a grower. It attains its best development the second or third year after sowing. In some of its features it resembles Kentucky blue-grass, the leaves have a bluish tint and the stems are rather stiff and wiry, but the panicle or head is narrower or less open than that of the blue-grass. It flowers later than the blue-grass, but the blades start early in spring. The quantity of foliage is not great but the grass is rich in nutritive matter, and well liked by stock, both as pasture and hay. It has generally been considered better for hay than for pasture because of its habit of growing in tufts, but in Kansas, in the localities where it is most successfully grown, it is considered an excellent pasture grass. Quoting from a Kansas grower, J. S. Gilmore, Fredonia, Kan., in the Twelfth Biennial Report of the Kansas State Board of Agriculture: "It furnishes more pasturage than any other of the tame grasses (not including alfalfa), comes early and lasts almost as late as any, and cattle thrive on it; it stands extreme cold and dry weather well, it restores and improves the soil, and does not require, like most tame grasses, the best land on the farm for a start and prosperous growth."

Meadow fescue is grown successfully in the area south of the Kansas river and extending westward from the Missouri line about a hundred miles. "The grass has been grown at this Station (120 miles west of the Missouri line) since 1879." It winter-killed in the winter of 1885-86 and apparently has suffered more than orchard grass from drouth. As a pasture grass orchard-grass has stood better than meadow fescue at this Station and furnishes more and better pasture. When cut for hay, yields of one to one and one-half tons per acre have been secured.

"Meadow fescue thrives best on the richest and heaviest soils, although it is grown principally on the slopes and uplands." In eastern Kansas it will do well on any land which will produce profitable corn crops.

In Kansas the grass is grown chiefly for its seed. Kansas is said to produce 75 per cent of the seed crop of the United States. Johnson county leads in the production of seed. The seed finds a ready sale in the European countries, where it is sown for meadow and pasture. The price is regulated by the supply and the foreign demand and has ranged from two to eight cents per pound. The largest seed crop produced in Kansas was harvested in 1896, and was estimated at 3,360,000 pounds. The yields of seed for the first three or four years after seeding average 6 to 12 bushels per acre (24 lbs. per bushel) although yields of 15 to 20 bushels per acre have been reported. In from three to five years the grass makes a less vigorous growth and the yield of seed decreases. The practice is to break the sod at the end of the fourth year and rotate with corn and other crops for a few years before seeding down again.

PREPARING THE SEED-BED.

It pays to carefully prepare the seed-bed in sowing any kind of grass seed, and the following suggestions will apply to alfalfa and other grasses as well as meadow fescue. The ground should be plowed several weeks or months before seeding time, and cultivated at intervals to clear it of weeds, conserve the soil moisture and put the soil in the best possible condition to sprout the seed and start the young plants. The seed-bed should be finished with a level, mellow surface, but with a rather compact subsurface, in order that the seed may be evenly covered and come in close contact with the moist soil. The seed should not be covered more than an inch to an inch and a half deep.

It is possible to prepare an excellent seed bed without plowing. Wheat or oat stubble disked soon after harvest and disked and harrowed at intervals until September 1 makes a good seed bed for fall sowing. For spring sowing, corn or kafir corn ground prepared by double disking and leveled with a float or harrow is usually preferable to spring plowing.

If it is necessary to plow just before seeding, the ground should be firmed by the use of the subsurface packer, float or roller. The disk harrow may be made to do the work of the subsurface packer in part by setting the disks rather straight and weighing the harrow.

SEEDING.

"The quantity of seed recommended to plant per acre varies from a peck to three pecks, when prodncing seed is the main object, and from one bushel to three bushels when pasturing alone is sought." On a well prepared seed bed in a favorable season, a practical method is to sow broadcast and to harrow once lightly to cover the seed. Many favor drilling, and this is perhaps the surer method of getting a good catch in the average season. The danger in planting with the drill is in getting the seed too deep, but if the ground is level and not loosened too deeply, the depth of seeding can be properly regulated.

Many practice fall seeding with good success, but it is not advisable to seed in the fall unless there is sufficient moisture in the soil to sprout the seed at once and insure the early growth of the young plants. A good catch of grass is more apt to be secured by the average farmer in the average season from early spring seeding, because the natural conditions are favorable for the germination of the seed. On the other hand, "a fall start brings a seed crop a year sooner and the grass gets dominant in advance of the weeds." There is slight danger of winter-killing if the grass starts well and the seed bed was prepared with a moderately firm subsurface. With a deep, loose seed bed, freezing and heaving out is much more apt to occur. Plant good, clean seed. The best seed is the cheapest to buy.

HARVESTING.

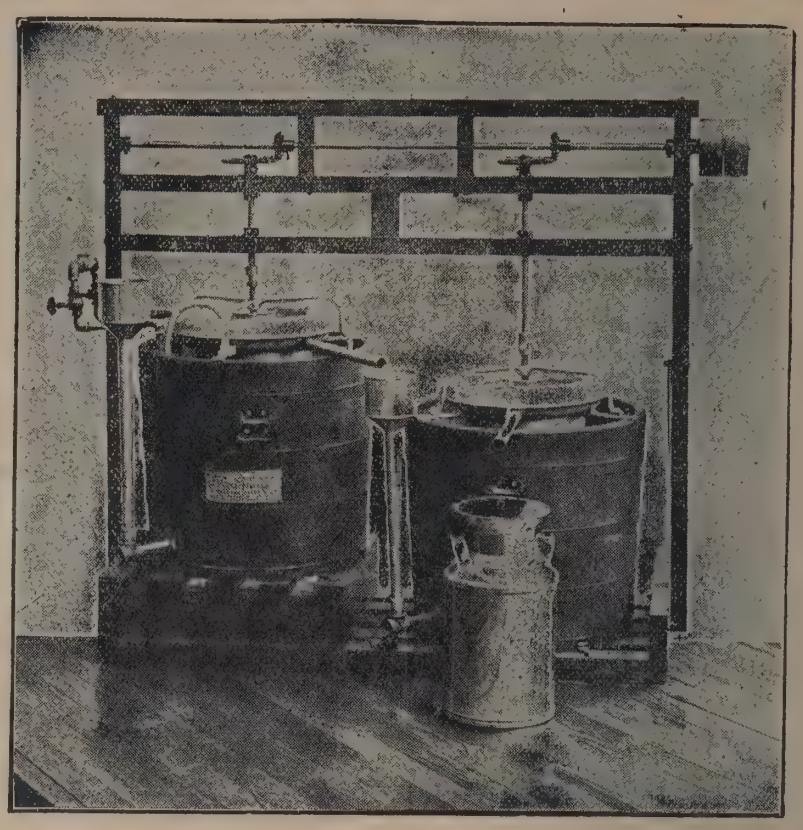
Meadow fescue should be cut for hay soon after the blooms fall. It is ready to cut for seed as soon as the heads turn brown, before the seed begins to shatter. This occurs right after wheat harvest. The usual method is to harvest with a self-binder and shock the same as wheat

Sleeplessness

Is akin to insanity. Many a woman realizes this as she lies awake hour by hour, peopling the darkness with phantoms, starting at the creaking of the bed or the rustle of the bedclothes.

Such symptoms in general point to disease of the delicate womanly organs, and a constant drain of the vital and nervous forces. This condition cannot be overcome by sleeping powders. The diseased condition must be cured before the consequences of disease are removed.

Dr. Pierce's Favorite Prescription cures the womanly diseases which cause nervousness and sleeplessness. It is the best of tonics and invigorants, nourishing the nerves, encouraging the appetite and inducing refreshing sleep.



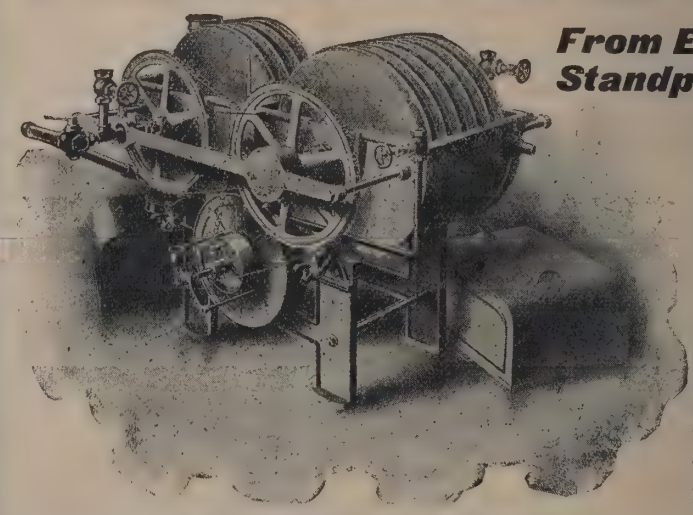
$500 Reward for Women Who Cannot be Cured.

Proprietors and makers of Dr. Pierce's Favorite Prescription now feel fully warranted in offering to pay $500 in legal money of the United States for any case of Leucorrhea, Female Weakness, Prolapsus, or Falling of Womb, which they cannot cure. All they ask is a fair and reasonable trial of their means of cure.

"My wife was sick for over eight years," writes Albert H. Fulte, Esq., of Altamont, Grundy Co., Tenn. "She had uterine disease and was treated by two physicians and got no relief. At last I read about Dr. Pierce's medicines and we decided to try his 'Favorite Prescription,' I sent to the drug store and got one bottle and the first dose gave ease and sleep. She had not slept any for three nights. Being sure that it would cure her I sent for five more bottles and when she had taken the sixth bottle she was sound and well."

Dr. Pierce's Pleasant Pellets should be used with "Favorite Prescription" whenever a laxative is required.

A GREAT SUCCESS.



The Miller Cream Pasteurizer has a capacity of from 450 to 600 lbs. per hour.

Price $150 in Tin. $200 in Copper.

THE MILLER PASTEURIZING MACHINE CO.

CANTON, OHIO.

A SUCCESSFUL PASTEURIZER

From Every Standpoint.

The only Pasteurizer made that pasteurizes milk heavily acid.

It makes good Butter — that makes good business.

Your Butter will score 8 points higher.

Milk Condensing Machine

I supply the most improved machinery and most successful processes for manufacturing all classes of condensed milk and evaporated cream. Factories built complete, put in operation and results guaranteed. If you are interested write for my new illustrated and descriptive catalogue. The only catalogue ever published on the subject.

R. R. ROGERS, Winthrop, Maine.
(Formerly of Detroit, Mich.)

I am not associated with any person, firm or company.

or oats. The crop may be stacked or thrashed out of the shock, with the ordinary separator. The seed is usually sold at once, but may be safely kept in dry bins or in sacks.

OTHER GRASSES VS. MEADOW FESCUE.

The fact that meadow fescue has proven to be a profitable crop when grown for seed has perhaps caused it to be valued more highly as a pasture and hay grass than it really deserves. Although no good comparative tests have been recorded, yet the general use of the grass at this Station has shown it to be inferior to orchard grass, both as a hay and pasture grass. It does fairly well for pasture when sown with orchard grass, the two grasses making a better sod than does orchard grass alone. For pasture, it is usual to sow about fifteen pounds each of orchard grass and meadow fescue with three or four pounds of red clover per acre.

Brome grass (*Bromus inermis*) has only been grown at this Station in a field way for four years. It has been cut for hay and seed and is being used for pasture the present season. As far as it has been tried, it is far superior to meadow fescue, both as a hay and pasture grass. It is more productive, more hardy, a better drought-resister, thrives in wet weather too, makes a better sod, stock eat it readily, and it is practically equal in feeding value to the meadow fescue. I have little hesitation in recommending it for planting for all parts of the state, as far west as Ellis county. It will doubtless thrive best in northern counties of the state. At the Fort Hays Branch Station, Superintendent Haney, reports a poor catch and crop from sowings made last fall. The spring sowings are much better. At this Station both fall and spring sowings have succeeded well. *Bromus inermis* may be sown broadcast, on land prepared as described above, at the rate of 18 to 20 pounds of good seed per acre.

Manhattan, Kan.

Importance of Pure Water for Milch Cows.

Typhoid fever has often been ascribed to a contaminated milk supply. As during the summer and fall when this disease prevails cows are frequently forced to get their drinking water from sloughs and stagnant ponds which may be contaminated with the germs of typhoid fever, it is important to know whether such germs find their way into the milk supply through the cow or by contamination of the milk after it is drawn from the cow. This matter has been the subject of very careful investigation by E. F. Pernot, of the Oregon Experiment Station, who administered various germs, including that which causes typhoid fever, to a cow and examined the milk and excreta obtained, for the presence of the germs. It was found "(1) that a pure culture of typhoid bacilli mixed with water and given to the cow to drink did not pass into the milk; (2) that they did not pass from the cow alive with the excreta; and (3) that they did not pass from the cow alive with the urine. * * * Although the results in this experiment have been negative in transmitting the germs from polluted water to the milk supply through the cow, it does not follow that the danger from cows using such water does not exist."

As cows frequently stand in the water to escape flies or to cool themselves, and their udders may thus become contaminated with the polluted water, investigations were made to determine to what extent germs in this way enter the teats and contaminate the milk. "The cow used in this work was a Jersey about 4 years old, with fair-shaped udder, good teats of medium size, reasonably easy to milk." The teats were dipped in water containing the germs and allowed to dry naturally. After the lapse of several hours milk was drawn and examined for the germs, but none was found, showing "that they were not taken into the udder by capillary attraction through the teat orifice." * * *

There is no doubt that there is a great variation in the teats of different milch cows. A teat possessing a weak sphincter muscle is imperfectly closed at its extremity and must necessarily be more accessible for bacteria to enter through the duct and invade the contents of the udder, while another teat having good muscular contracting power, would be less likely to admit germs. Yet it seems almost impossible that any moist muscular orifice could so contract as to shut out an organism of such minute dimensions, especially those like typhoid, which are actively motile.

It is generally believed that micro-organisms gain access to the milk in the cow's udder through the teat, but in this case they did not, although the result might not be the same with all cows.

Even if it should be proven that milk is not contaminated in this way, the danger is not removed, because the body of a cow which has been wading in impure water is itself a source of contamination, since it is impossible to milk such a cow "without particles of material falling into the milk and carrying with it innumerable germs. This we know occurs to such an extent that it is customary to strain the milk to remove the particles of foreign matter. When a bacteriological study is made of this sediment the number and kinds of these germs found are truly surprising. If all the germs thus entering the milk would remain in the sediment it would be all right, but unfortunately, dropping into the milk with this foreign matter, the germs are liberated through constant agitation incident to milking. As warm milk is a very suitble material for germs to grow in, especially typhoid-fever germs, the number which would multiply in twelve hours from the few introduced at the time of milking would be enormous and dangerous." On this point, R. H. Forbes, of the Arizona Station, says:

When a cow wades belly deep into a filthy pool festering in the heat and fouled with excretions, her milk will inevitably suffer. Not only will the foul odors of the water she drinks be imparted in some measure to the milk, but millions of bacteria, adhering to her hair and udder, will, when she is dried off and milked, find their way as dust into the milk pail. Quick souring of milk in warm weather and undesirable changes in butter and cheese, caused by bacteria, result.

It would seem that these are sufficient reasons why cows should be prevented from having access to foul water, but there is the additional reason of danger to the health of the animal from disease germs which may be present.

Although these are dangers that it is well worth while to guard against, it is evident, as Mr. Pernot points out, "that outbreaks of typhoid fever occur which, if the cause were carefully traced, would be found to come not from the milk as it leaves the cow, but from vessels which had been washed with contaminated water," and he calls attention to the fact that "since the advent of the cream separator, which is usually driven by steam power, steam has been used to clean all the utensils in the dairy. Not only is it efficient for this purpose, but as a germ destroyer there is nothing better, because it penetrates to the bottom of the seams and heats the metal to such a degree as to kill dangerous germs."—*U. S. Farmers' Bulletin.*

D. H. Otis, Professor of Animal Husbandry at the Kansas State Agricultural College, has resigned his position, to become manager of the Doming Ranch at Oswego, Labette County, Kansas, at a salary of $2400 per annum, with free house rent, fuel, garden, cow, chickens and horse and buggy. Professor Otis will take up his new duties as soon as he can complete the bulletin work he has on hand.

WISCONSIN
Farm Lands

$8 to $12 PER ACRE.

On terms to suit purchaser. We would like to show you the lands and can give you low railroad rates to come and look at them. This is the future dairying country of the Northwest.

Our lands are only 240 miles from Milwaukee with splendid markets on all sides. None of the land lies more than three and a half miles from the railway station. Write and find out about it. Yours very truly,

INTERIOR LAND CO.,
Janesville, Wis.

GOOD REASONS

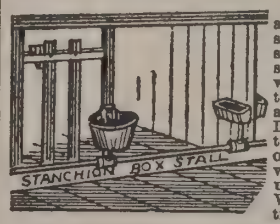
why land buyers are attracted to Marathon County are: Because of the richness of the soil; abundance of water at little depth; fine grazing making it a very desirable location for cattle raising; excellent railroad facilities and competitive markets for dairy, farm and timber products. Central and Northern Wisconsin will be

THE COMING DAIRY SECTION

and has already made great strides in that direction, many fine herds have been established. If you want to Own Your Own Home now is the time to buy. Our lands are located in the northwestern part of Marathon County in a country well populated, near the prosperous village of Athens. For prices and further particulars address:

RIETBROCK LAND & LUMBER CO., ATHENS, WIS.

FOR SALE



My fine country home and dairy farm of 120 acres within 1¼ miles of Waukesha city limits and electric line. This farm is well watered and fenced, and well equipped with buildings painted and in good order; 10 acres wood lot, balance under plow and in high state of fertility. For particulars address
O. P. CLINTON, Waukesha, Wis.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn, (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a 320 acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired, Price $19.00 per acre.

FINE DAIRY FARM WAUKESHA CO., WIS.

We offer 274 acres of which 125 acres are under plow, 104 acres oak timber. Good orchard, fine dwelling house and other dwellings. Excellent soil in first class condition. Well watered for stock.
MILES & MYERS, C-100 MATTHEWS BLDG., MILWAUKEE, WIS.

Intense Cultivation and Large Hay Crops.

ED. HOARD'S DAIRYMAN:—I have just completed cutting my first crop of hay. Commenced July 6th, ended July 21st, 15 days. Last year, first crop was 64 tons, 874 pounds of dry hay; this year, first crop was 55 tons, 729 pounds, nine tons less than last year. The loss was due mostly to three causes: First, lack of intense cultivation before seeding of six acres in Sept. 1901, on account of cloud burst which washed most all of the intensely cultivated soil off the field ten days before seeding. Second, a two months' drought in spring. Third, the fertilizer was spread six weeks without rain. These three causes cut the volume down so that the average product was but 7,840 pounds, a little less than four tons per acre. The ⅞ acre, seeded now 14 years, cutting 26 first and second crops before this year, a total of 104¾ tons, yielded this year, first crop, 12,410 lbs., making the total product in 27 crops, one seeding, 14 years, 111 tons, with the second crop now growing. Last year the two crops were 8½ tons this year they will exceed 9 tons. The average per acre this year on this field, first crop, is 7 tons, 176 lbs., and on the ⅝ acre adjoining, 7 tons, 80 lbs. While the sum total is less, yet a portion of my field is heavier than ever before, notwithstanding my fertilizers lay bleaching 6 weeks in the sun without rain.

Much has heretofore been said about the weight of my hay, whether put in the barn dry or otherwise, and also what green grass in drying would shrink. I have made some tests this year with the following results. I have taken from several sections, 5 square feet of grass and found the following results: 4 lbs., 2 oz., mostly all timothy, produced when dry 25½ oz., or 13,638 lbs. to the acre; 4 lbs., 5 oz., mostly all red top, when dry produced 20 oz., or 10, 880 lbs. to the acre; 4 lbs., 6 oz. timothy and red top mixed, 25 9-16 oz., or 13,706 lbs. to the acre. In another section, mostly red top, 4¾ lbs. produced when dry, 25¾ oz., or 14,021 lbs. to the acre. Another section, 4 lbs., 5 oz. a little less red top, 25½ oz., or 13,638 lbs. to the acre. Still another section, 2 lbs. mixed, when dry gave 9 9-10 oz., or 5,206 lbs. to the acre. I have kept track of the weights of the hay on these several sections per acre and they made but a few pounds more to the acre when dried out than indicated by the samples.

The directors of the Connecticut Agricultural College wish to have me save a few specimens of hay from my field to exhibit at the St. Louis Exposition in 1904, which I have done.

I have no doubt, however, that many will be surprised at the height of the grass. Judging from many of the thousands of letters that I have received in the last few years, many suppose that six tons of hay or more to the acre means tall, coarse grass, but it is exactly the reverse. It means a dense growth of fine grass. Five to six hundred spears to the square foot, forty to forty-five inches in height, will make six to seven tons to the acre. Every six inches in height of my grass containing five to six hundred spears to the square foot, will produce a ton of dry hay to the acre, and it will be as fine as silk.

Intense cultivation and care is the only thing that will make big crops of hay. If you send to me, George M. Clark, a two-cent stamp, I will send you a grass circular that will tell you how six tons of dry hay to the acre can easily be made. I have written more than 20,000 letters in the last two years and sent out one or more of my grass circulars with each letter to tell my friends how. I have led the way, but am glad to say now that many are beating me; still the good work goes on.

There has been an impression among the farmers that this theory of intense cultivation and resulting large hay crops, so often spoken of by me, was introduced for the sole purpose of benefitting the Cutaway Harrow Co. To all such, I wish to say that as early as 1872, twenty years before the Cutaway Harrow Co. was ever thought of, the Higganum Mfg. Co. commenced the manufacture of drag plows, both regular and reversible, and I as president and at the head of the mechanical department, made and completed over four hundred different sizes and styles of drag plows. In the completion and test of these plow patterns, I used 16 acres of this old, rocky land to test the strength of these plows.

The old Higganum Mfg. Co. made at one time over eighty thousand drag plows per year, and in testing these new plows on that rocky land came the finding of the benefit of intense cultivation. With the aid of such men as J. H. Hale, Mortimer Whitehead and other advanced agriculturists the science of intense cultivation had been growing gradually, long before the Cutaway Harrow Co. was started or ever thought of. In fact, it has been but a few years that I have allowed my name to appear in connection with the business of the Cutaway Harrow Co., or any other Co. for the reason that people would say: "All Clark is after is to push the Cutaways."

It was not until Professor Albert E. Cook, Professor of English in Yale College, who corrected the English in my grass circular, said that I should by all means allow my name to appear in connection with the Cutaway Harrow Co., that I allowed it to so appear.

This is the origin of intense cultivation and large hay crops. Whether the Cutaway Harrow Co. lives or dies they have come to stay. GEORGE M. CLARK.

Higganum, Conn.

Here We Have It.

ED. HOARD'S DAIRYMAN:—After reading through an issue of your paper I wonder why so many persons are fooled into taking a periodical filled with such nonsense—so-called book dairying, so many theories and so much tom-foolery in general—gotten up by men paid by you, Mr. Editor.

I wish I could afford to board you a while. If I could I'd have you come to this section and talk with our dairymen, and if you did not go home calling me blessed, and regretting that your attention was not called to this matter sooner, I would be willing to make you a present of the best cow to be found in this section. And I want to say right here that we have some good ones—cows that bring in their owners as high as $40 annually. Of course they won't all do this well. You couldn't expect it. And these cows don't cost their owners over $35 per year for their keep. This leaves the owner as you will readily see $5, just for interest on cost of cows, milking, feeding and other necessary work.

Mr. Editor, you may know more about silage, balanced rations, pasteurization, Babcock testers, dairy form, etc., than

Cattle Stanchions.
Simplest, safest, strongest, most easily adjusted swinging stanchion made with steel latch and automatic lock, locking itself when closed. Is stationary when open, and animal cannot turn it in backing out. Made from best selected hardwood, well finished. Send for circulars and prices. Made only by

A MILK PROBLEM

THE AVERAGE MILKMAN'S COW		
2920 quarts of milk at 5c.		$146.00
Keeping	$35.00	
Expense of sale	33.80	68.80
Net		$ 78.20

A WINTERGREEN HILL COW		
Gave over 6000 quarts in one year that was sold for 8c per quart		$480.00
Deduct for keeping	$ 65.00	
Expense of sale	120.00	185.00
Net		$295.00

The Jersey is sometimes condemned as an insufficient milker for milkmen's use. It is not true, however, of such strains as are bred for deep milking qualities as well as richness. Above is the record of one of the deepest milking daughters of "Exile of St. Lambert, 13657," and the herd contains other heavy milkers. If you would improve your herd by a bull calf, buy him now while you can. A little book tells much about the subject. Write for it, and for bull sale list. See also advertisements on pages 514 and 536.
WINTERGREEN HILL FARM, Dept. A., Scottsville, N. Y.

THE BROWN BESSIE HERD Offers one bull 14 months old, sired by Recorder, 29239, the only living son of Brown Bessie and has 14 tested daughters. Dam, Relay, 70353, test 17 pounds 2 ounces. She a daughter of Diploma with 61 tested daughters. Also Berkshire Pigs of English and American selected stock.
H. C. TAYLOR, Orfordville, Wis.

Rosendale Guernsey Herd
TUBERCULIN TESTED.
Sixty head of choice Guernseys headed by Coralette's Son, (see page 450) whose dam, Coralette made 479.7 lbs. fat in one year at 3½ years old, and was first prize cow at Wisconsin State Fair in 1896.
Some fine young bulls for sale.
GEO. C. HILL & SON, Rosendale, Wis.

Wasteland Guernseys
Herd headed by Sir Coral, 5239 (son of Coralette, 560 lbs., grandson of Fantine 2d, 607.7 lbs.) and Glenwood's Sheet Anchor of Haddon, 6372, (son of Glenwood Girl 7th, 506.5 lbs., and grandson of Rutilla's Daughter, 571.4 lbs.) Some elegant young bulls and bull calves for sale.
M. M. & E. J. HOLLINGSWORTH, Landenberg, Chester Co., Pa.

GUERNSEYS.
HADDON FARMS—Home of the noted GLEN WOOD GIRLS—First in the Advanced Registry. Have always been free from tuberculosis. E. T. GILL, Haddonfield, N. J.

Old Homestead Guernseys.
Greatest Prize Winning Herd of the Breed, defeating all competitors at 22 state fairs during last five years. 20 cows of this herd indicated by Babcock test, an average of 456 pounds butter per cow for one year. Several bulls of service age, and a large number of bull calves for sale; also a few choice females.
Especially low prices, standing of herd considered. No catalogue. State what you want.
L. V. AXTELL Perry, Lake Co., Ohio.

GUERNSEYS FOR SALE
Bull two years old out of Count Topsy 24.27 lbs. butter 7 days. She won 1st prize at Wis. State Fair 1902. Also a few yearling bulls and bull calves. FRED CLAUSING, Grafton, Wis.

GUERNSEYS FOR SALE. The increase of my herd is a few young things of both sexes, from one to eighteen months old. Prices corresponding to age and quality F. W. TRATT, Whitewater, Wis.

VALLEY FARM Offers for sale a son of "King of St. Lambert's King" out of a daughter of "Gazilla's Fawn," dropped July 29th., 1900. Also have some young bulls. Write your wants to
FRED STUBLEY, Black Earth, Wis.

ROBINSWOOD JERSEY DAIRY is offering a few Reg. Jersey Bulls ready for service at from $25 to $50, sired by a grandson of Recorder, the only living son of Brown Bessie, out of good cows. Write, stating your wants, to
N. H. ROBINSON, Prop., Centralia, Wis.

ST. LAMBERT BULL CALVES, by Lucy Stoke Pogis 4th, sire of 13 tested cows, $25.
W. J. HUSSEY, Mt. Pleasant, O

the dairymen of this section, but it is evident from what I have read in the DAIRYMAN that you lack a knowledge of the essentials of practical, common sense dairying. You don't seem to know anything about keeping cows upon corn stover, nubbins, timothy hay (it doesn't pay to grow clover) straw, ice water and a board fence on stormy days for shelter; but instead, you would have your readers grow clover (worth on the market about half as much as good timothy,) put up silos, buy high priced concentrates, etc., etc. Dairymen of this section have ideas of their own. They are independent, thinking men. They have original ideas of their own.

The farmers (the progressive ones) make money keeping bulls. They don't run to some breeder of "fancy" cattle and pay a big price for a bull with a pedigree, when they can, by watching, pick up a nice yearling of a neighbor for about $20. With a large number of cows in a neighborhood at 50 cents each, a bull soon pays for himself, and the owner gets the use of him upon his own herd practically for nothing. By this method the dairyman is liable to get more $40 producers. I suppose Friend Gallup, of Lime Creek, who had a short article in the DAIRYMAN some time ago, won't agree with all I have to say, for I have heard that he went to the expense of buying a Holstein bull last fall; then this spring bought two cows of the same breed. But he may live to see his mistake, as I have seen mine.

I have heard more right-down, practical, dairy wisdom in a few minutes' talk with some of my neighbors than I could get by a half day's reading of dairy literature. Before moving into this neighborhood, I had heard so much about HOARD'S DAIRYMAN that I decided to subscribe for it. Then I had been led to believe that to be really up-to-date I must study such books as Warring's Chemistry of the Farm, King's Physics of Agriculture, Woll's Book on Silage, Henry's Feeds and Feeding and a lot of other books, besides a stack of station reports, bulletins, etc., a foot or two high.

Now I see how badly I was duped. I can learn more in a few minutes' talk with my neighbors, than in ten times this amount of time spent poring over the above mentioned literature. You will see many good dollars and much valuable time have been wasted. Before learning where I was at, I tried to persuade some of my friends to subscribe for HOARD'S DAIRYMAN, but they were not to be fooled as I had been.

Another thing I almost forgot to mention. It may seem of little importance, but 'tis quite important after all. Last winter I helped a neighbor milk his cows. One cow I started to milk gave thick, ropy milk. I called my neighbor's attention to this, when he said, as the milk was going to the factory, it made no difference. Now, Mr. Editor, you would probably tell your readers such milk was unfit to use. Just think of the pin money a pint of such milk twice a day from 25 or 30 cows, part of each year, would bring the dairyman. And if each one of your subscribers could be induced to waste this milk, see what a large amount of money would be thrown away.

I did not intend to make this article so long, but I guess 'twill be just as well, for undoubtedly the editor has become so thoroughly grounded in his way of thinking upon dairy matters, that nothing less would induce him to change his views.

Now, Mr. Editor, please read this carefully, then publish in the DAIRYMAN, so that your readers may be thinking these matters over while you are bringing your dairy teachings down to a more practical basis.

Another thing I almost forgot to mention. After helping the neighbor referred to, milk his cows, I ventured to remark that some of them hardly paid their board. Here again, my theories caused my humiliation.

This man was no exception to the general run of dairymen in this section and was not apt to be led by some one's theories to put more into his cows than he could get out. He was feeding about 15 pounds of shredded stover per cow, each night, and about the same amount of whole stover scattered about the yard each morning. Then the cows could eat all the straw they wanted to. But as the latter was valued only at its manurial worth what straw the cows ate was clear gain.'

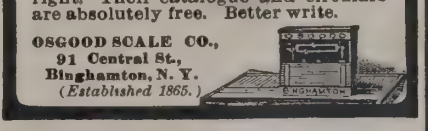
You will see at a glance that these cows were costing their owners considerably less than 4 cents per day. These cows were all fed alike. Another thing I have learned. A thousand pound cow won't eat any more than a ten hundred pound cow, so what's the use of bothering to feed each cow differently.

Now, Mr. Editor, with all your knowledge of protein, carbohydrates, crude fibre, ether extract, scientific feeding and what not, can you feed cows more economically than this herd was fed? Nit! Now, isn't it plain that the weight of evidence is against book farming, theoretical dairying and all kindred fads? And to be consistent you must surely change your mode of instructing your fellow dairymen through your paper.

If this does not find its way to the waste basket I may in a future article give your readers some of the things I thought I learned from my books, pamphets, papers, bulletins, station reports, etc. J. D. P.

Mich.

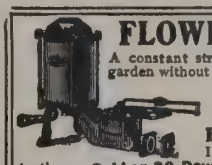
Alfalfa Experience in Wisconsin.



ED. HOARD'S DAIRYMAN:—I have just finished putting in my second crop of alfalfa, and, as I owe my success, thus far, to knowledge obtained from your valuable paper, I feel under obligations to give the benefit of my experience to others, who may be thinking of trying it. You published, during the winter of 1902, an article from the pen of C. P. Goodrich, which was my guide. In the article referred to, he told us to sow the seed with oats at the rate of one and a half bushels per acre. My land is very rich and the oats grew exceedingly rank. I cut them for hay July 23. At that time the alfalfa plants were very feeble and in spots where the oats had lodged, there seemed to be none left alive. It grew rapidly, however, and was knee high by the middle of September. It came through the winter all right, and was ready to cut the 8th of June. I had three large two-horse-wagon-loads of beautiful hay, from the acre and a quarter and just six weeks from the first cutting, I cut it again. The second crop yielded nearly the same as the first, at least three tons, secured without a drop of rain and no loss of leaves. Should I sow any more, as I doubtless shall, I think I would sow the alfalfa alone. I am not sure but the cover crop would be all right on poorer land, but with me it would certainly have been better not to have sown the oats. They grew more than three feet high and shaded the alfalfa so as to weaken it, and in places kill it out entirely. A. S. C.

Ripon, Wis.

No You Don't, Young Man!



No more guessing for me. I put in a new **Osgood Steel Trussed Lever Stock Scale** this spring, and now I sell my cattle at my weight at the farm. They treated me right. Their catalogue and circulars are absolutely free. Better write.

CHOICE BULLS FOR SALE.

Also Cows and Heifers bred to Clay Buttercup, 196861, a descendant of the Clay Family, champions at the World's Fair dairy test.
GEO. WENHAM, Fort Atkinson, Wis.

White Grubs.

ED. HOARD'S DAIRYMAN:—The insects popularly known as "white grubs" or *Lachnosterna. Sp.* are very numerous this year and are damaging pastures, hay fields and lawns. These grubs are the larvæ of one or two species of May beetles (June bugs), which fly about dwellings during the warm evenings of May.

LIFE HISTORY.

The beetles appear during the early part of May and soon after the females deposit their eggs among the roots of grasses and other succulent plants. The eggs soon hatch and the young grubs begin to feed on the roots. During the latter part of summer the grubs reach maturity and construct rude chambers or cocoons in which they transform into perfect beetles. The beetles do not leave the ground until the following spring, when the same round of life is repeated. Some species of white grubs require two years to mature.

APPEARANCE OF THE GRUBS.

If the grubs are present in sufficient number, the root system of the plant is completely devoured and the plants die. The eating capacity of these grubs is enormous. A single grub will devour more than its own weight of food in a day. The presence of the grubs, which is not noticeable until considerable damage has been done, is indicated by the gradual withering and drying up of the sod. The top layer of the sod, to the depth of about two inches, is separated from the rest of the roots so that it may be rolled up like a blanket.

Ordinarily the grubs are not present in sufficient number to cause noticeable damage, being kept in check by parasites and birds. The ravages by this pest is now at its height in many places and within a short time the grubs will be full-grown and enter into the pupa stage, after which they do not feed on the roots. Whether the presence of the grubs this year will cause an epidemic next year, depends upon weather conditions and parasites.

REMEDIES.

Since the grubs feed under ground, the application of Paris green and other arsenious poisons is not practicable. Infested pastures and meadows should be fall-plowed, rather shallow, and harrowed a few times before the winter sets in so as to expose the insects to the winter weather. It is not advisable to plant badly infested land to corn, especially if it has been plowed in the spring. Clean culture is the most effective way of fighting this insect.

TREATMENT OF LAWNS.

Infested lawns may be treated as follows: Dissolve five pounds of common brown laundry soap in a barrel of water and apply the solution to the infested lawn, thoroughly saturating it. Then water thoroughly to carry the solution further down. The remedy will not kill the grubs if they have already constructed their chambers. Where the grass is killed before the pest is discovered, do not disturb the surface,—first kill the grubs, then sow lawn grass seed, rake the sod lightly and water when the top becomes dry. In the fall apply a liberal dressing of barn-yard manure. The grass seed may be sown any time provided the soil is kept moist.

It is sent absolutely free, freight prepaid on 30 days trial. A word to the wise is sufficient. Write at once to "1900" Washer Co., 219A State St., Binghamton, N. Y.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

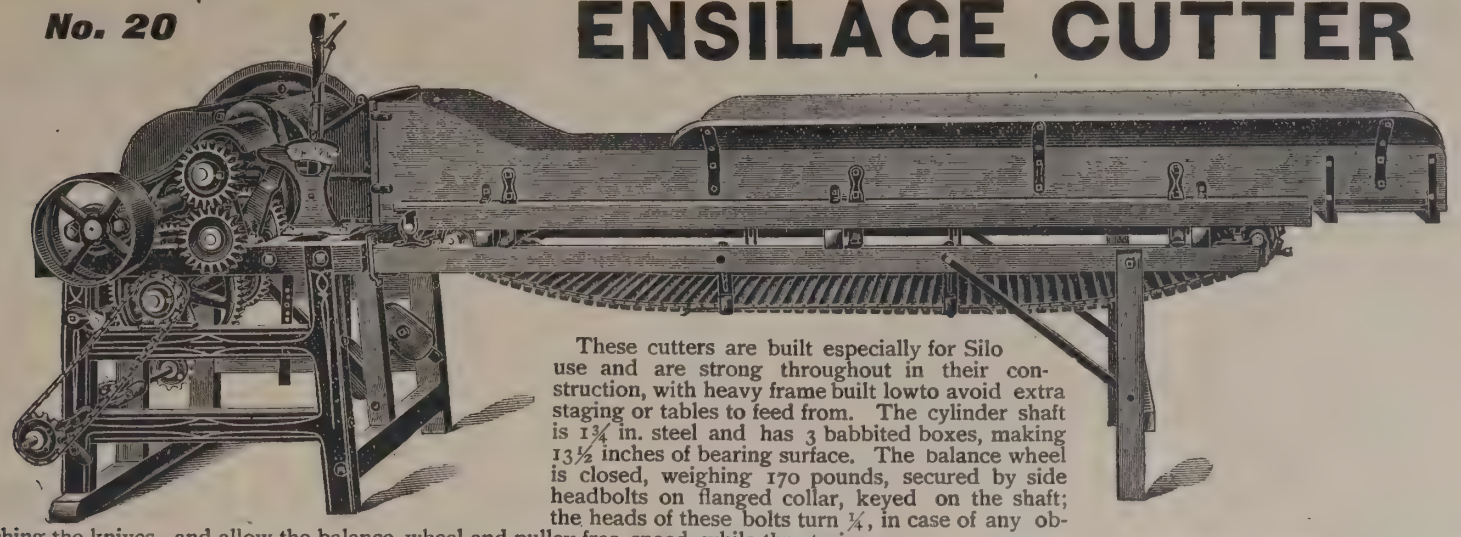
First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.



Sizes run from 150 lbs. to 500 lbs. per hour.

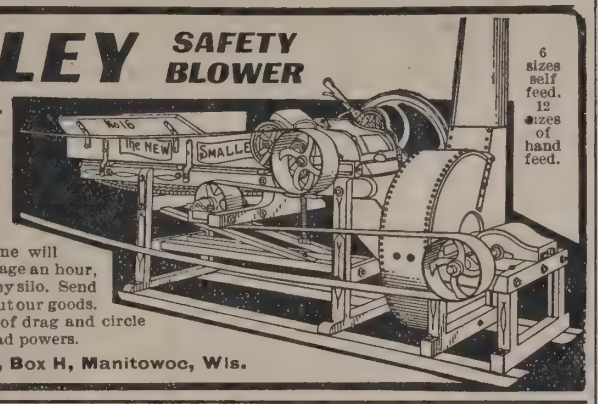
BUSINESS MANAGER wanted for company now organizing to manufacture Patented article for dairymen's use. Must invest $2,000 to $5,000. Fine opportunity. CAN REFRIGERATOR CO., 425 W. 4th St., Erie, P

No. 20

ENSILAGE CUTTER



These cutters are built especially for Silo use and are strong throughout in their construction, with heavy frame built lowto avoid extra staging or tables to feed from. The cylinder shaft is 1¾ in. steel and has 3 babbited boxes, making 13½ inches of bearing surface. The balance wheel is closed, weighing 170 pounds, secured by side headbolts on flanged collar, keyed on the shaft; the heads of these bolts turn ¼, in case of any obstruction reaching the knives, and allow the balance wheel and pulley free speed, while the strain on the knives is relieved at once. The traveling feed table iscontrolled by the reversible lever and is instantly stopped or reversed. The slats on these tables travel over a close bed, full length and are close together to prevent fine leaves getting into them and winding on the rollers, also guards over the chain links. The length of cut is easily adjusted from ⅜ to ⅝ and ⅞ inches by the gears on the shaft. We furnish chain elevators of any length desired, straight away or side delivery. Weight of Cutters with traveling table, 1600 pounds. Send for circulars.

I. B. ROWELL CO.,
MENOMINEE FALLS, WIS.

SMALLEY SAFETY BLOWER

Only One Belt Required.

No lost power. No danger in operation. Belt cannot slip. Every part strong and of best material. No more strain on the *Smalley* machine when Blower is attached than with the ordinary carrier. Largest size machine will easily handle ten tons of ensilage an hour, cut ¾ inch and elevate into any silo. Send for 1903 catalogue, tells all about our goods. We also make complete line of drag and circle saw machines, sweep and tread powers.

6 sizes self feed. 12 sizes of hand feed.

SMALLEY MFG. CO., Box H, Manitowoc, Wis.

WE GUARANTEE that under the same conditions as to power and speed applied, condition of corn, etc.,

The Appleton Corn Husker

will do more and better work than any other machine of like character and corresponding size on the market; that it is simpler in construction; easier in every way to operate; easier and safer to feed and to require less power for successful operation. The proof of these claims is sent for the asking. We make also a complete line of sweep and tread horse powers, shellers, ensilage and fodder cutters, feed grinders, wood saws, windmills, etc. **Remember that Appleton quality is the standard of excellence.**

2-Roll, 4-Roll, and 6-Roll, Down or Mounted.

Write to-day for free Catalogue.

APPLETON MFG. CO., 35 Fargo St., Batavia, Ills.

SAVE THE WHOLE CORN CROP

A corn crop may be profitable without saving the fodder, but it will be twice as profitable if it is saved. The new method of handling corn saves the entire crop. The new way is to run all the corn through

JANNEY'S PATENTED HUSKING PIN — IT TAKES OFF THE SHUCK

JANNEY COMMON SENSE CORN HUSKER and FODDER SHREDDER

If you feed corn hay you can sell all your meadow hay. You can also bale and sell your surplus corn hay; big demand. You may add further to your profits by husking and shredding for your neighbors. Pays better than a threshing machine and costs less. Eight years in the field; more in operation than any other.

Best made. It husks all the corn and shreds the fodder into "corn hay." Corn hay is the equal in feeding value of best timothy hay Ask your dealer or write us for Husker Catalog.

Quack Grass in Alfalfa.

ED. HOARD'S DAIRYMAN:—Have any of your staff had experience with alfalfa on land which was infested with witch grass? In a recent number of the *Breeder's Gazette*, W. J. Spillman states that in Texas alfalfa will thrive in a field infested with Johnson grass and that the latter will gradually disappear.

If alfalfa will grow in witch grass, I believe that it will be of great value to many of us here in Maine. H. L. S.

East Dixfield, Maine.

We know of no way of getting rid of witch grass, except by removing it bodily, root and branch from the land. Plow the soil, harrow and rake off the roots and burn them. This may have to be done more than once, as every piece of root will start a new and vigorous plant. Repeated plowing will kill it off in a dry season, but in the average year, only removing the roots will bring success.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

CONCERNING OUR ADVERTISERS.

FLIES CAUSE LOSS OF MILK AND FLESH.

For the next 60 days you will see cows and horses standing in fence corners, under trees and in pools of water, switching their tails and fighting the horrible torments of flies. It will be money profitably invested if you will protect your stock and horses by spraying them with some reliable Fly Repellant. Many of our subscribers have used Rippley's Fly Remover, manufactured by the Rippley Hardware Co., Grafton, Ill., and they claim that their cows give at least 25 to 35% more milk and their horses work and drive better and increase in flesh after being sprayed with the above preparation. You surely cannot invest money to a better advantage at the same time giving relief to your stock, than to use some reliable fly repellant.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Swelling on Udder.

I have a heifer that has a swelling on the rear of her bag. This morning I milked her, what I could get and rubbed the bunch forward. She has not been served yet. Did you ever have such a case? M. H.

Windsor, Conn.

ANSWER.

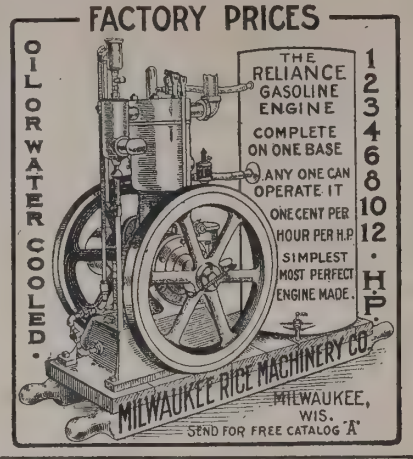
If the swelling has been there for some time and continues to be hard, it most likely contains pus or blood serum, which may be opened with the knife and the contents let out. The cavity should be washed clean, and tincture of iodine injected into same. This will absorb the sack and prevent it from refilling, On the other hand, if the swelling is soft you may paint it once daily with the tincture, which will tend to absorb the exudate.

A Strange Disease.

For some weeks past a large proportion of the young cattle in wild pastures, viz., marsh grass and brush land have been afflicted with a disease of the eyes. A pouch or swelling covers the eye,

For the land's sake—use Bowker's Fertilizers. They enrich the earth and the men who till it.

THE ANTI-BUTTING
And Fighting Halter.



For hornless cattle that are given to butting and fighting, and making all kinds of trouble with their heads, shoving gates, doors, and fences.

It is a most excellent thing for bulls that are inclined to be cross, and is especially adapted to young bulls when they begin to rub their heads against posts and trees and corners of buildings, taking their first lessons in the mischief and deviltry they learn to do so well with their heads when they are older.

Write for circular and price list. It will cost you nothing to know more about it, and where you can get it when you need it.

quiet the creature and make milking a pleasure. It increases the flow of milk, too.

CARPENTER-MORTON CO., BOSTON.
Ask your dealer. If he hasn't got it, will send gallon can, express paid, for $1.00.

Rippley's Fly Remover

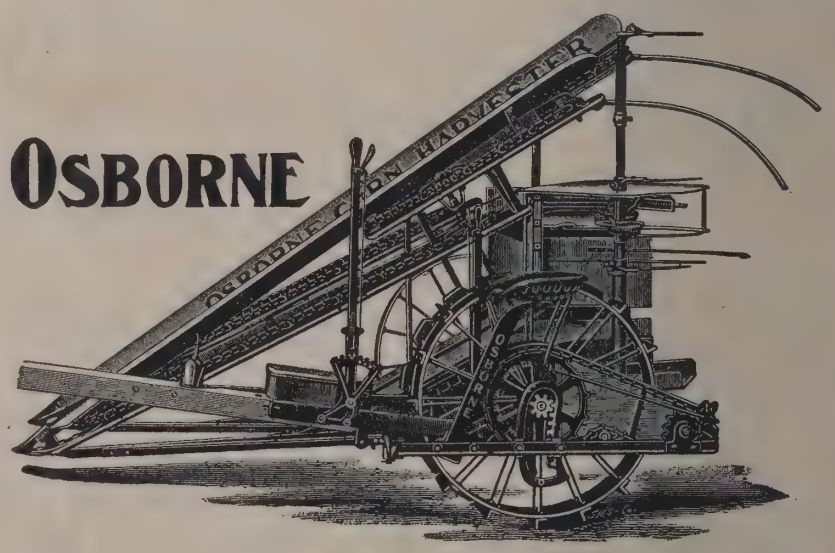
instantly removes all flies, mosquitos, lice and other insects from cattle, horses and other animals sprayed with it. It is healing to any sore. Animals rest easy and feed quietly all day. Cows give ¼ more milk, which is a big saving. 1 gal. will protect 500 cows. Endorsed by the best class of people. Order at once and secure agency, you can sell hundreds of gallons. 1 gal., $1.10; 2 gal., $2.10; 5 gal., $4.50; 10 gal., $9.00. RIPPLEY'S Special Sprayer for applying same, 65c; 4 gal. Compressed Air Sprayer for applying same on large herds, $5.00; 5 gal., 5.50. Money refunded if not as represented. Our Breeders' Supply catalog mailed free; tells how $8.00 per head can be saved by using Fly Remover; ½ bbl. lots of 30 gal., $25; freight paid on 20 or 30 gal. lots.

Gentlemen:—For three years I have been experimenting with different things to keep flies off my cows, but not until I tried your Fly Remover and Compressed Air Sprayer was I successful. I used this last year and found that it costs less than one cent per week per cow. With your Compressed Air Sprayer it takes but a few minutes to put it on, and the result has been that my cows were free from flies, and during the year gave 6400 pounds of milk each, which made 324 pounds of butter per cow. I can heartily recommend it to all stock owners.—JOHN ARMSTRONG, President State Board of Agriculture, De Smet, S. D., June 4, 1901.

RIPPLEY HARDWARE CO., Box 20, GRAFTON, ILL.
Western Office, Watertown, S. D.

The Old Way—Kicking Corn With Knife Fastened to Boot

FARMERS DON'T KICK NOW!
Their corn is cut with
DEERING IDEAL CORN BINDERS
Deering Corn Binders gather all of the corn. They do not waste. They are constructed on the grain binder principle; the corn is bound while in a horizontal position in the same manner as a sheaf of wheat. They do not knock off ears.
Deering Corn Binders, Corn Shockers, Huskers and Shredders
are money-makers for the farmer. Ask the nearest Deering agent for a "Deering Corn Annual."



The New Way—DEERING CORN BINDER in the Field

D. M. Osborne & Co., St. Louis, Mo. Caledonia, Mo, June 1, 1903.

My Dear Sirs—I feel I honor my own judgment, and reflect only that which is justly due your corn harvester, when I say it is without doubt the best corn harvester on the market to-day. Last season I cut, on my own farm, 115 acres of corn, and a negro boy 16 years old managed the machine, drove the horses and did all the cutting, without one cent expense for repairs or breakage. The work could not be excelled. The corn was heavy and much of it down, and some full of weeds, but it made no difference to the machine. All corn looks alike to an Osborne Corn Harvester, and to Missourians your machine is peculiarly adapted, for it can most certainly "show them." I am, Yours very truly,

W. R. GOODYKAUNTZ,
Ex-Senator of Missouri.

OSBORNE

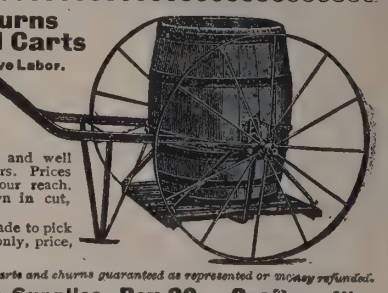
This Corn Book tells about Silos and Fodder. Book Free for the asking.

Scotia, N. Y., April 15, 1903.

D. M. Osborne & Co., Auburn, N. Y.

Dear Sirs—I am well pleased with the Osborne Corn Harvester I purchased of your agent, C. H. Bevis, last fall. It proved to be all it was commended. On account of the season, several places in our corn fields were deep mud, but where we cut there the machine worked just as good. The broad-faced steel drive-wheel is a great advantage on ground where it is soft. We used only two horses, and did the work easier than some of our neighbors did with three horses on another make of machine. It is certainly a very light runner. It is also a fine binder, never once having broken the twine, or missing to tie, thus using less twine than others, besides delay and trouble. I would say, in a word, that the machine is practically perfect. Very truly yours, CHARLES P. SANDERS.

RIPPLEY'S Granite Churns and Steel Carts
are the Cheapest as they Last Longest and Save Labor.



OUR GRANITE CHURNS are made of heavy 3 coat enamel, all parts removable, can be used as a cream jar, will not rust nor corrode, butter will not stick to them. Easy to clean. Churns butter in 5 to 10 minutes.

Less platform, made to pick up and haul bbls. only, price, $5.00.

5 per cent discount allowed if you order a churn and cart. Carts and churns guaranteed as represented or money refunded.

RIPPLEY HARDWARE CO., Mfrs. Breeders' Supplies, Box 20, Grafton, Ills.

Goodwin's

T. D. Goodwin & Co.,

USE GOODWIN'S FLY KILLER
this season and make your stock comfortable. Your cows will give 25 per cent more milk; your beef cattle will fatten with one-half the feed and your horses will do their work with ease. Goodwin's Fly Killer will protect stock from flies when in pasture as well as in stable. It's convenient, cheap, practical. It's a sure lice killer and will keep stables and hog pens in a sanitary condition. Prices: Gallon 75c; 5 gallons $3.00; 10 gallons $5.50. Good sprayer for applying same 50c, or send $1.00 for Sprayer and enough Fly Killer to protect 150 cows. Agents wanted. T. D. GOODWIN & CO., Columbia Station, Ohio.

entirely obscuring the sight, continuing for more than two weeks. The animals affected apparently graze and drink as usual, without noticeable shrinkage in weight. Have not heard anyone speak of any discharge from the eye. The disease thus far has been limited to young stock.

Chippewa Falls, Wis. MRS. L. E.

ANSWER.

Your trouble appears to be contagious, (judging from your description), and requires the immediate action of the State Veterinarian, whose duty it is to promptly stamp out or prevent the spread of such diseases, for which he is drawing a good annual salary from the state. Have your local Board of Health notify him again, and if he does not respond please report to this department.

Foot Rot.

Will you please give me the best reciept for fouls in cows. C. E. M.

Heart Lake, Pa.

ANSWER.

Foot rot, or otherwise know as fouls, see page 541 of the DAIRYMAN.

Red Water.

We have a disease among the cows in this portion of the country known among cow keepers as red water. Cows affected begin to lose flesh and run down; sometimes last a year and longer. I have one, three years old, milking with second calf, on which it has made an appearance.

Portage, Wash. B. B.

ANSWER.

This is an albuminous disease of the kidneys. The colored condition of the urine is due to the presence of the coloring matter of the blood in the urine.

Cows calving when thin and in a weak condition, are predisposed to this disease. Grass containing acids, may cause it. Make a change in feed or pasture, and give nitrogenous food, and begin at least a week before calving time, so that they will be stronger and prepared to meet the heavy drain on the system, as the disease usually developes when the cow gives the largest flow of milk. You may give a quart of raw linseed oil, and follow this with a tablespoonful of tincture of iron twice daily.

Cholera, Perhaps.

I have lost 70 young pigs. Begins with a cough, hard breathing; some bleed at nose, act dull and stupid; some loose at bowels, others constipated; does not attack old hogs as yet. C. T. O.

Chicago, Ill.

ANSWER

Judging from your brief description, your hogs have cholera. If this is the case, you should at once remove all the healthy animals from among the herd, and thoroughly clean and disinfect quarters in which there have been none of the affected ones, nor should they be allowed to come in contact with each other. There is but little hope if an animal is once affected, but you may, in this way, prevent the disease, from doing further damage among the healthy animals.

DON'T LAY OFF

a horse merely because he has a sore back, neck or shoulder. Treat him according to directions with

BICKMORE'S GALL CURE.

Guaranteed to cure all **Harness, Collar or Saddle Galls** while you work the horse or money refunded. LumpJaw Spavin Curb Splint Sweeny

Cure Them

Lump Jaw in cattle, Fistula and Poll Evil in horses, and almost every blemish that a horse can have, even bad Bone Spavin, Ringbone and Knee-Sprung, can be readily cured by anybody. We want to tell you how to do it, prove that you can do it, and guarantee you success in doing it. Two big booklets explaining everything sent free. Write now.

Fleming Bros., Chemists, 225 Union Stock Yards, Chicago, Ill.

Calves That Scour

Get run down, even if they do not die. Hood Farm Calf Scour Cure and Digestive Powder, used in connection, cure scours promptly; keep calves from shrinking.

$1 and $2.50. Sent to any railroad express point in U. S., 25c. extra. C. I. HOOD & Co., Lowell, Mass.

Our New Patent

and Great sales are the talk of all who know of them. A fortune has been made by the patentee and the farmer in a short time. For seven months the sales were over $350.00 per day. Something good can't be gotten for nothing. By putting $500.00 and upwards into this business it will be the best paying investment we know of. Farmers using the machine say that they would not do without it for two, three, and ten times the price. Common farmer can handle it in a very paying way. We can prove the great selling qualities of this machine by bank account, the bankers themselves, and the farmer. Our plan is fair and honest. Best bank references. Car fare one way will be paid to responsible men whether they invest or not. Address

THE LAWRENCE-WILLIAMS COMPANY, Cleveland, Ohio.

"Just as good?" "Just as good!" Did you say? "Just as good as Veterinary Pixine!!" The dealer who tells you that is mistaken. He does not know.

FACTS AND TESTS PROVE IT!

Emery, Ky., April 9, 1903.

I feel it my duty to tell what Veterinary Pixine did for a horse of mine. He was cut with a knife between the fore legs three inches deep and two inches long, which every minute would gap open. I used several different kinds of remedy without success, even to having some stitches taken. Nothing did any good and it kept swelling and became feverish. I almost gave up hopes of getting him well. In the columns of the Ohio Farmer I observed your advertisement and, as it was the last chance, I purchased a box at the druggists and used it as directed and before the box was used up the cut was entirely well. I intend to keep a supply on hand for emergency cases if I have to pay a dollar a box for it. Please accept my thanks for the good I have received from its use, and if you choose you can use my name and testimony.

W. S. CAMPBELL.

This penetrating, stimulating, soothing, absorbing, antiseptic, healing ointment heals from beneath the surface by disinfecting the parts, subduing inflammation and stimulating healthy granulations, not by drying and scabbing, and stimulates growth of hair, natural color. Makes quick, clean and healthy cure; heals stinging, burning, chronic saddle and collar galls, hopple chafes, abscesses, caked bag, cow pox, and hoof rot. What Dr. Alexander, Prof. of Hygiene Chi. Vet. College, Instr. in Vet. Science Wis. Univ. Says About Zenoleum Dip:

"I use Zenoleum in my practice and in my Scotch Collie breeding kennels because, from long experience, I have found it perfectly reliable, standard in manufacture and effective in a host of ways. For the same reasons I confidently recommend it to stock owners who write to me for advice. It emulsifies beautifully with water, making a solution which has neither sediment nor scum and is a trustworthy disinfectant, antiseptic, deodorizer, parasiticide and vermifuge. A hundred uses are found for it on every stock farm, and it has proven indispensable in my veterinary hospital. Especially valuable in outbreaks of hog cholera, skin diseases, lice and scab, and I advise its daily use where contagious abortion is prevalent among cattle." A. S. ALEXANDER, V.S., Evanston, Ill.

Cost to produce (purchased feed only) $1.06 per 100 qts.

This farm contained 130 acres from which was raised twenty-five tons of hay; five acres of oats threshed seventy-nine bushels and about three tons of straw. The pasture was six-year-old sod until Aug 1st then pastured on the new grass field. They only pastured during the day until Aug 1st, when they were near the barn and the fences were better. With the thermometer about zero we drove the cows across the fields of snow, if any, to water after cutting the ice possibly 8 to 12 in. thick. Under these conditions the feed purchased did not show the profit that was possible; had they been handled like I suppose Mr. Grote's are there would have been several dollars more profit.

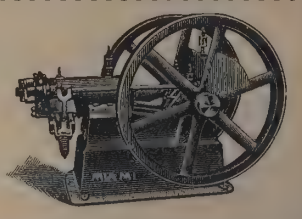
The feeds were bran, hominy meal, Quaker dairy feed, King gluten meal, cotton seed meal and dried distillers grains. We also had about 1,000 bushels of corn stover the farm raised, which we cut and feed dry. The dairy—twenty-two head, all grades, mostly Jerseys; three aborted when about five months along, and one cow I never saw fresh. While others may show a larger profit when they use some home grown feed to help out, I believe this is getting very near the limit under the conditions. This covers work at Coaterville, Pa.

Clayton Station, Mo. H. D. D.

Three Meals a Day.

As an indication of the value of HOARD'S DAIRYMAN to a farmer who is willing to mix brains with his work, the following bit of testimony seems eminently pertinent:

J. A. S., of New Vienna, Ohio, in submitting an inquiry which is answered elsewhere in this issue, adds the following paragraph: "Success to HOARD'S DAIRYMAN! Before I took the paper, dairying was just about to drive me to the poor house, but since taking and studying it, my wife is able to get three meals a day.



GOOD INTENTIONS ALONE CANNOT PRODUCE GOOD MACHINERY. Most all manufacturers are honest, but lack the experience and equipment necessary to turn out a thoroughly first class engine. We are the founders of the Gas Engine industry in the United States; have been building **OTTO** engines for 27 years, and operate the largest and most complete plant in the country devoted exclusively to the building of Gas and Gasoline Engines. Which will you buy, **Otto Experience** or **Others' Experiments**

The Dairy Farmer as an Example of Prosperity.

(Continued from page 586)

printed business letter heads. They are business farmers, owning fine herds of high-grade or registered dairy cattle.

"Let us take Jefferson county, Wisconsin, the home of HOARD'S DAIRYMAN, as an example. It is 24 miles square and has a population of about 40,000. In 1870, its agriculture had reached its lowest ebb. Farmers had engaged in wheat raising until they had so reduced the native fertility of their land that the average crop of wheat was eight bushels per acre. The farms were heavily mortgaged to the extent of 60 per cent of their assessed valuation, and their average value was $20 per acre.

"The farmers of Jefferson county took up dairying. Today, this is in many respects the wealthiest county, agriculturally speaking, in the state. It has met Holland's boast, and has a cow to every inhabitant. Its cows earn annually nearly two millions of dollars. The bankers of this little county have on deposit over $2,000,000 belonging to the farmers.

"The census reports give some astonishing figures and squarely illustrate what I have in this article contended, that the dairy business places a community financially in position where they can be liberal patrons of advertisers. In 1870 the census reports gave the total value of agricultural products of Jefferson county as a million and a quarter dollars; in 1900 on the same land, the value of the agricultural products was over five million dollars. Is there any agricultural advertiser who would contend that Jefferson county would be as good a field for him in its condition of 1879 as it is in 1900, when it is earning nearly $4,000,000 more? There is no mystery in this, no juggling with figures; of course, better markets will account for some of the increase, but the major portion has no other cause than dairying.

"Let the agricultural advertiser think back to the hard times of '93 and '94. If he closely analyzed his business and advertising at that time, he found good dairy sections standing out to him as would an oasis to the traveler in the great Sahara. Years ago, when many of the present agricultural advertisers left the farm, dairying meant a few pounds of butter to be swapped weekly at the country store for calico and groceries. But there has been a great change in agriculture. Farming is becoming specialized like most every other line of business, and any man on the farm who has the brains, backed by get-up-tiveness to make a success, is fighting it out usually on some one line. If he is a thinker, he can hardly avoid it.

"Dairying is attractive to the progressive thinker on the farm, because it gives him a field where his brains can earn the money. It is the intelligence he exercises in the feeding and breeding of his stock, and how he handles their product that makes success, and this is constant study; it is not simply a case of keeping the weeds out between the rows and getting ahead of frost. This is why, I say, the unprogressive man on the farm does not take up dairying, and that those who are in dairying are progressive men.

"To the agricultural advertiser, the dairy farmer certainly presents an unusually rich field. When he compares them with the average farmer they look like a 'sifted and sorted people,' they are the owners of the fine barns and farms on which are seen the large herds of fine dairy cattle, with the appearance of thrift, comfort and prosperity pervading the whole place. That's the dairy farmer, and that's the farmer that the business man envies as he passes through agricultural communities. They are not existing on so much land as simply pensioners in the soil. Intellectually and financially, they can be found among the best of every community.

"When a farmer goes into dairying and stock raising, he at once measures his business by higher standards. It means better buildings on his farm, better fences, better breeding, better feeding, better homes, better machinery, better equipment everywhere and a better man."

Painkiller PERRY DAVIS'

The world-known household remedy for cuts, burns, bruises—cramps, diarrhœa and all bowel complaints

Watering the Herds

WITH the fencing of the ranges has come the need for an artificial water supply upon the great stock farms of the West. That cattle may thrive and fatten for the market, it is absolutely essential that this supply be both *constant* and *abundant*. The picture shows a typical scene upon many of the largest ranches, where the **HOT AIR PUMP** is delivering its supply into the storage tank, whence it is drawn off daily as required, in any volume up to 100,000 gallons. No driving of the herds to some distant river is required, thus much expense is saved and the cattle drink quietly, as nature dictates, at an *ever ready* and *abundant* supply. Descriptive Catalogue sent free on application.

Rider-Ericsson Engine Co.

Remember, the Hot Air Pump is Automatic, requires no skilled attention, and is the cheapest form of constant water supply now known.

MY SOW RAISED 15 FINE PIGS

Newman, Ill., April 3, 1903.

International Stock Food Co.

DEAR SIRS:—I have been a feeder of **"International Stock Food"** for over 3 years. I have a sow, perfectly white, 3 years of age, weighs 375 or 400 lbs. She is very lengthy in build and has been fed **"International Stock Food"** from the time she could first eat. She was bred to a Poland-China boar and two days ago she had 15 nice, plump pigs. Ten of them are white and five black. The pigs are in good flesh and doing nicely. **"International Stock Food"** is a great preparation for hogs and pigs. Yours truly, JOHN OLIVER EAGLER.

☞We Have Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine and Unsolicited.☜

We own "International Stock Food Farm," which is located 12 miles from Minneapolis and contains 650 acres. We feed "International Stock Food" every day to all our WORLD CHAMPION STALLIONS, DAN PATCH 1:59 1/5 and DIRECTUM 2:05¼; to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. "INTERNATIONAL STOCK FOOD" ☞3 FEEDS FOR ONE CENT☜ is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite and Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It is Absolutely Harmless even if taken into the Human system. You insist on eating medicinal ingredients with your Own food at every meal. Salt is a stomach tonic and worm medicine, Pepper is a powerful stimulating tonic, Mustard is a remedy for dyspepsia, Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these Medicines promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High-Class Farm Paper. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Fifty Thousand Dealers throughout the World. ☞Your Money will be Promptly Refunded in Any case of failure. It will make your Calves or Pigs grow Amazingly and has the largest sale in the World for keeping them healthy. ☞Beware of the many Cheap and Inferior Imitations. No Chemist can separate all the Different powdered Roots, Herbs, Barks and Seeds that we use. Any One claiming to do so Must be an Ignoramus or a Falsifier.

CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true**. All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

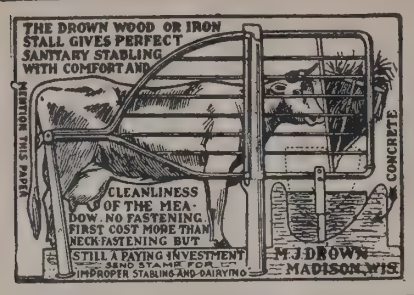
THE TUBULAR
Separates the Separators

YOU learn what a man or machine CAN DO by knowing what that man or machine IS DOING. You base your conclusions on facts---not talk.



THERE is a machine that has revolutionized dairying—it is a cream separator. There is a machine that has revolutionized cream separators—it is the Sharples Dairy Tubular Separator.

THE Tubular is unlike any other separator ever made! It's a "Right Now" machine—an "Izzer"—that has made "Has Beens" of all other separators—a machine of great merit—of strong reputation—in use by thousands of farmers and dairymen. It has proved its ability to skim cleaner, turn easier, clean quicker and better, wear longer, need fewer repairs, than any other separator, and do it every day, too. It's a Tubular Bowl—three simple pieces—all other separators have bucket bowls full of troublesome parts.

A New York Dairy County.

ED. HOARD'S DAIRYMAN:—It is generally conceded that Delaware county stands first in the state of New York as a dairy county. There may be another that surpasses in quantity of products, though I have not the statistics at hand to prove it, but in proportion to area, Delaware is ahead even in this respect. When it comes to the question of returns per cow, the quality of the milk and the general conditions for successful dairying it may be doubted whether another region of equal area can be found that possesses characteristics equally favorable for the dairy industry. It was the privilege of the writer recently to make a trip into that section, going well over into the Catskill region. At this time I will mention only a few of the features that impressed me. The lofty hills and the hillsides, where are springs of such abundance, both as to numbers and the volume of flow, are matters of general knowledge. It seems to me that the source of these springs must be in the dense forests which for miles crown the hilltops, and make the region one of picturesque grandeur.

Here is essentially the home of the Jersey cow, and here she has champions without stint. For miles along these hillsides one sees no other. Not all are thoroughbred, but nearly all are high bred, and many are eligible for registry. It was in another territory not twenty miles away that a locally noted dealer in cattle told me a few months ago that he had purchased and sold thousands of grade and full blood Jerseys in years past, but that now he can scarcely sell a Jersey. His market, however, is in the east where milk is sold for city consumption, and without regard to richness.

In this neighborhood where I visited, an Ohio dealer came last fall and took out 500 or more of these Jerseys, and shipped them to his state. Trust a Buckeye granger to know a good thing when he sees it. The cows are of good size and strong, and are good milkers. My friend has probably no more than an average herd, but when I saw him, his twenty cows were averaging slightly over four hundred pounds of milk a day, the feed being fairly good pasture and nothing more. It is only recently that the creamery has invaded the interior of the county to which I refer.

It was my pleasure to call upon the gentlemanly foreman and part owner of one of these creameries, Mr. Geo. Polly, of Andes. The milk is all purchased on the test, the price being one cent per pound below the highest New York quotations for the butter, calculating upon the test with a 12 per cent overrun; that is, after the test has been made, 12 per cent is added to the amount of fat, as shown by the test. There are only about fifty patrons, but the daries are large and the receipts of milk ran up close to twenty thousand pounds per day.

The sheet of tests for the first ten days in June was shown me from which I calculated an average of 4.56 per cent of butter fat. Some of the patrons told me that they got more pounds of butter to their credit at the creamery, last year, than they obtained the year previous by working the milk up at home; besides, they received better prices. All this, in spite of the fact that there is no railroad within twelve miles, and all goods have to be transported by teams over the hills. Usually skim milk is sold back to the dairyman here at ten cents per can, but to encourage raising good calves for cows, the milk was sold back till June first, this year, at 5 cents per can. The future interests of the dairyman and of the creameryman lie along the same lines.

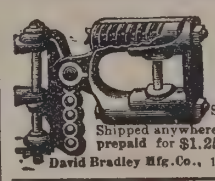
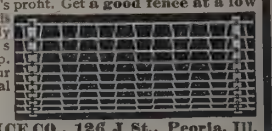
Palmyra, Wis.



Griswold Square Mesh Field Fence.

The best of all **Lawn and Field Fences.** Is hog proof. Manufactured in 18, 24, 33, 39, 50 and 56 inch heights; in 20 and 40 rod rolls. The narrow widths can be supplemented to any height desired by Barbed or Plain wire, or two strand twisted Cable wire. Manufacturers of **Diamond Mesh Fence. Plain, Galvanized, Barbed or Telephone Wire. Wire Nails and Hay Bale Ties.** Write for illustrated catalogues and price lists. **Dillon-Griswold Wire Co., Sterling, Ill.**



SENT out under positive guarantee. Money refunded if not satisfactory. No bolting food. Perfect digestion. All tinned—no rust.
KEYSTONE CALF FEEDER
Patented under No. 721,384. Used in about forty experiment stations. Mass. Ag'l College writes as follows: Mr. M. T. Phillips, Dear Sir:—I write to say that the Calf Feeder is giving excellent satisfaction. We have found it to be all we could ask for in a feeder. It is easily cleaned and appears to be durable. Yours truly, E. A. JONES, Supt.
Complete with extra nipple, $1.50, express prepaid. Circulars free.

A Model Dairy Barn.

Temporary Home of the Louisiana-Purchase Fair Jerseys.

Following is a descri ption of the farm and buildings which Mr. A. O. Austen has placed at the disposition of the American Jersey Cattle Club as "training quarters" for the cows selected to represent the Jersey breed at the Louisiana Purchase Exposition in St. Louis, next year. The illustrations are from photographs sent us, and we may be pardoned for calling attention to the circumstance that the general plan and arrangement follow substantially the suggestions made in the Dairyman for constructing dairy barns, with the exception that we do not approve the concrete platform for the cows to stand and lie on, and we suggest to Mr. Graves that he cover this platform with plank.

On one ot the most beautiful farms in Illinois, at Jerseyville, in Jersey county, is a herd ot the best Jersey cattle in the world. The animals are the property of individual members of the American Jersey Cattle Club, and they are assembled because they are the best qualified to make up the herd that will represent the Jersey breed in the great dairy demonstration planned by Chief F. D. Coburn for the World's Fair in St. Louis in 1904.

No athlete who was ever conditioned for an event requiring the development of strength, endurance and skill ever received greater care and more intelligent attention than is being bestowed on this herd of full blood Jersey cows at Jerseyville. When the great test begins at St. Louis, at the opening of the Louisiana Purchase Exposition on April 30, 1904, the herd will have been in constant training for a full year.

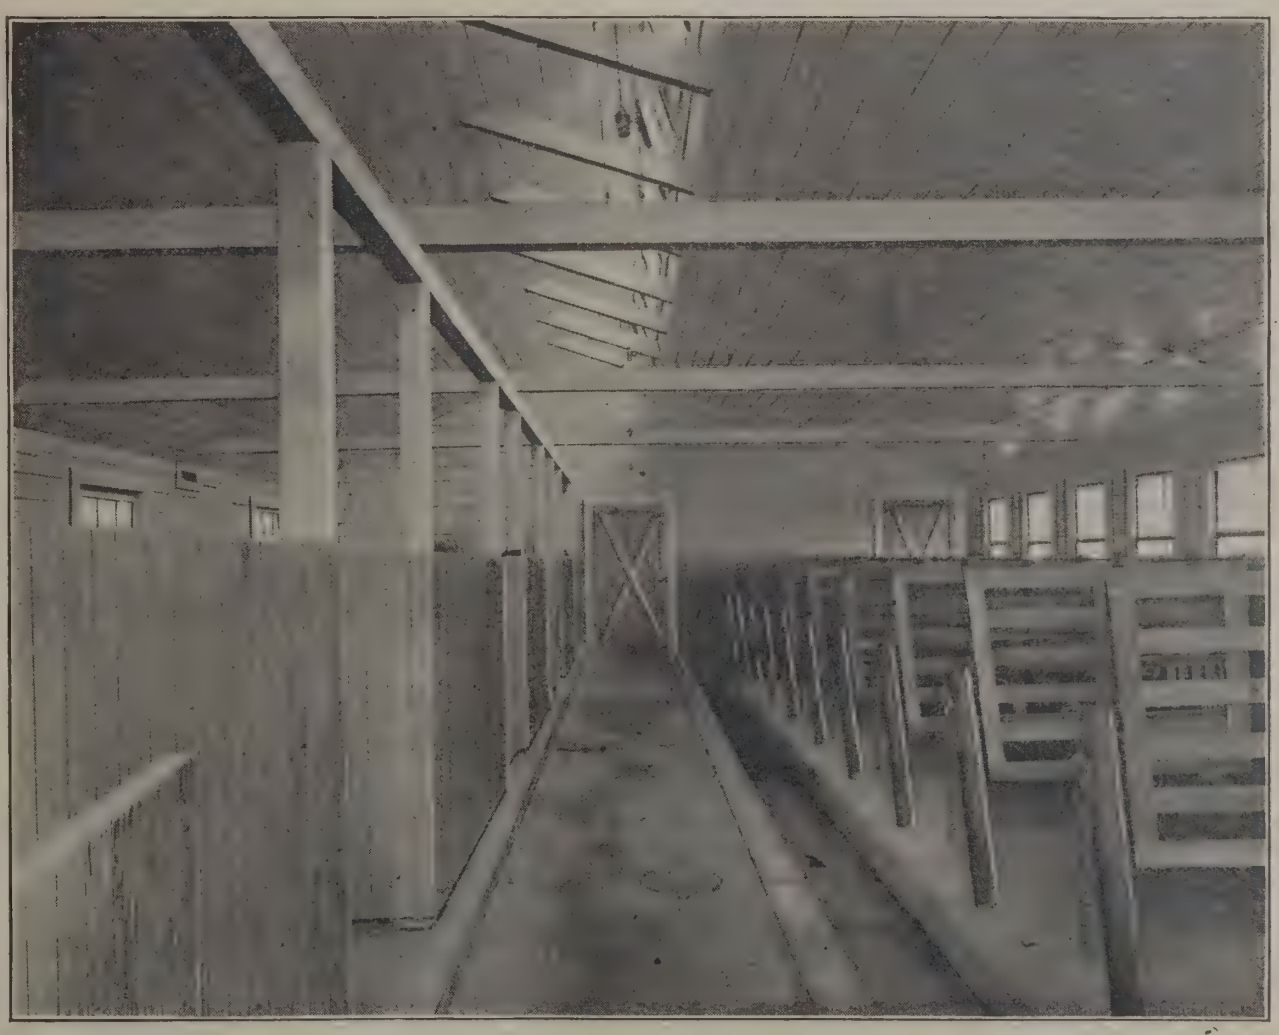
Only 25 cows will participate in the test. The greatest possible care was taken in selecting the animals for this herd, and the committee in choosing had at their disposal any of the 250,000 registered Jersey cows in America Even more changes may be made in the personnel of the herd. If a cow should become ill conditioned or should develop some malady, it will be removed from the herd. J. J. Richardson, the chairman of the committee, is now touring Europe, and will visit the famed Jersey Island and other European points, where he will make further selections if suitable candidates be found.

When the Louisiana Purchase Exposition Company announced the large prizes for the breed of cattle that would make the best dairy test, the American Jersey Cattle Club determined to show every strong point possessed by the Jerseys. Many millionaires are members of the club and they resolved that cost should not stand in the way of anything that would be of value to a perfect showing.

To get together the herd, selections were made from widely different sections. Maine contributes one and Oregon another, and many intermediate points furnished still others. Were they to arrive in St. Louis just a short time before the exposition they would not be acclimated nor at their best. Therefore an assembly place near St. Louis was a necessity.

Mr. A. O. Auten, of Evanston, Ill., proposed lending the club one of his farms, near Jerseyville. Ill., and the offer was accepted. This farm, comprising 400 acres, adjoins the cityof Jerseyville on the south, and is, ideal. A handsome residence, formerly occupied by Mr. Auten and his family, is just outside the city limits and adjoins 10 acres of splendid pasture. This is now occupied by the family of Mr. C. T. Graves, a well known breeder of Jersey cattle, at Maitland, Mo., who was selected to manage the great enterprise. He moved to Jerseyville early in 1903, and began his campaign.

First he planned a new cow stable for the reception of the fine cattle when they should begin to arrive. The stable was completed early in July, and it is probable that not another barn in the world is as complete in every respect as this. The structure fronts the south. The barn is square, with stable wings on the north and east ends. The north wing has stalls for 24 cows, and the east wing has stalls for 12 cows and six large box-stalls.



Mr. Graves designed the barn and stables, and they are marvels of convenience and cleanliness. An electric power plant is in a separate building, and the entire premises are lighted with electric lights. The barn and stables have numerous windows, all of which are perfectly screened. Electric fans are scattered throughout and the air is kept in constant motion.

Cleanliness and perfect sanitation were ever in Mr. Graves' mind. No unpleasant odors can be detected and the stables are always scrupulously clean. The cows are ranged in stalls that extend the length of the wings. Their heads are at rows of windows where they always get fresh air. The floors are all concrete. Between the rows of cows is a broad granitoid passage way and a gutter sloping to the center, affords perfect and natural drainage. The floors of the stalls are also of concrete, and they are covered thick with clean straw, for bedding.

The mangers are also concrete. They are of new construction. The walls all slope to the point nearest the cow's head, and while the tendency is for the animal to push the food away from her, it always falls back into the manger, in front of her nose. A gate is at the cow's head. This gate is so arranged that it may be put forward or back so as to fit the cow's length, and keep her rear feet just at the edge of the gutter. A chain at the back passes under the hollow of the animal's legs and prevents her from backing off the floor of the stall, into the gutter.

Buildings at Jerseyville, Ill., when the Jersey Herd is Being Prepared for the St. Louis Fair.

Interior of one of the Stables, Showing Arrangement of Stalls.

The stalls are simply a series of folding gates, and all of the 12 stalls, or as many of them as are needed, may be instantly converted into one big stall. The side gates swing either to the right or left, and may be folded up into a groove over the manger. When the cow is in the stall, however, the partition is strong and rigid. The cows may be led out at either end of the stalls. Then the hose may be turned on and the floors flooded in a short while. The drainage is so perfect that the water runs off readily, and the floor dries quickly. In the floors of the passage way, between the rows of cows, are large round openings in the

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

A FACT IN THE CURING OF CHEESE.

Many people like new, uncured cheese. They are not aware of the indigestible character of such cheese. The following statement, which is scientifically true, will illustrate the point we are making concerning the superior digestibility of well cured cheese. This statement is made by Prof. Vivian formerly of the Wisconsin Experiment Station.

"When the cheese is first made, the casein or curd, is in perfectly insoluble condition, no part of it being soluble in water. In the space of about a year, however, half of this casein has been converted into a condition which is soluble in water. In other words it has been digested, for we find upon chemical analysis that the changes taking place are very much such changes as will take place in the stomach and intestines— that is the true digesting, and we have the digestive products. Cheese should never be eaten that has not been well cured, for if eaten in such condition it is apt to cause very serious derangement of the digestion.

A SPLENDID GUERNSEY COW.

Mr. J. P. Welsh, of Bloomsburg, Pa., sends us a statement of the yearly record of his Guernsey cow, Mary Marshall 5th No. 11814. This cow was dropped April 3, 1899. Her dam was the renowned Mary Marshall, the cow that won the grand prize over 50 competitors of all breeds at the Pan-American, in Buffalo. The sire was Manager 3399, one of the noted bulls of the breed.

Mary Marshall 5th completed her year's record under the official supervision of the Pennsylvania Experiment Station, April 30, 1903. During the year she gave 9,306.3 lbs. of milk, which yielded 474 lbs. butter fat, equivalent to 554 lbs. of butter.

Concerning her make up and form the owner says: "Mary Marshall shows her breeding in her remarkable dairy form. She is large and vigorous and rich in color. Her skin is remarkably yellow. She has thin thighs, high cut flanks, sharp withers, a very prominent spinal and pelvic development, a broad, well defined escutcheon, and an unusually large udder."

An interesting fact is contained in the statement that Mr. Welsh makes, that this cow produced all this milk and butter fat on the same feed as was given to the remainder of the herd of 30 cows. Herein is seen the value of good dairy blood. This cow took her feed and by virtue of the superior organization of her dairy machinery she produced the phenomenal record as given. In other words, she extracted from her feed three times as much butter fat as ordinary cows do.

The same law applies in trotting horses. The horse that can trot a mile in 2:10 does not eat double the feed that the horse does that trots in 4:20. Herein lies the true philosophy for the dairy farmer to consider. He should train his thought and perception to breed as closely to the dairy line as he can, in order that he may secure cows that will extract the largest amount of butter fat, or milk, or cheese, from his feed.

INTERESTING DATA ON THE RELATIVE VALUE OF MILK TO THE COST OF CHEESE.

Prof. Van Slyke, the noted chemist of the New York Experiment Station, made the following statement at the Ohio Dairy Convention last winter:

"In general it costs less to produce a pound of cheese in the case of rich milk than in poor milk. I will give you some data on this point. At our Experiment Station at Geneva, N. Y., we spent some years in studying the relative value of several breeds of cows with reference to the production of cheese. Here are some of the figures we obtained. These results represent the average of several individual cows for one period of lactation:

	Holstein.	*Ayrshire.*	*Guernsey.*	*Jersey.*
Per cent fat	3.36	3.60	5.30	5.60
Cheese yield per cow	755 lbs.	681 lbs.	703 lbs.	685 lbs.
Cost of cheese per lb	6¾ cts.	7¼ cts.	6½ cts.	6½ cts.
Profit per cow	$12.02	$7 00	$13.87	$13.42
Relative profit	172	100	198	192

THE FARM SEPARATOR SYSTEM.

The following from Prof. McKay is suggestive:

"Many think this is a backward step toward the old gathered cream system. Whether this is true or not, it is evident that a lot of educating will have to be done in caring for the cream on the farm to bring the quality up to the whole milk system."

Well, who knows but what right there lies the crowning value of the farm separator system? It imposes the necessity for more and better knowledge on the farmer. The present system has relieved him of all sense of responsibility for the outcome in the market. The whole milk creamery has stepped in between the farmer and the market. He can hardly see what the effect of his action and management will be. The creamery proprietor and the buttermaker do not feel that it is their business to educate him. In most instances he does not see that he needs to put himself to any trouble or expense to educate himself. If he was making butter on the farm and sending it to the city on commission, then the market would educate him right quickly. It would show him at once the market value of keeping in touch with all useful knowledge on this dairy question.

The serious weakness of the present creamery system lies in its deadening effect on the mental interest and growth of the farmer who supplies it with milk.

If the farm separator will work a reform in this particular; if it will stimulate or compel the creamery proprietor and butter maker to do more than they have been doing to spread dairy knowledge among the farmers; if it will compel the farmer himself to see his serious need of better knowledge, more intelligent methods, and a broader, more enlightened judgment, then surely it should be hailed with delight and adopted with alacrity.

Anything that will break up the deep crust of indifference to their own advancement which prevails among so many farmers who play at keeping cows, will soon correct its own evils, and advance the cause of intelligent dairy farming immensely. We think the farm separator will aid largely in doing this, for the farmer not only produces the milk as he did before, but he makes the cream, which brings him one step nearer bearing the burden of responsibility for the character of the butter—and that cannot help proving a great educator.

Milk Testing Inquiries.

ED. HOARD'S DAIRYMAN:—The following inquiries have been received:

"I am hauling milk to a cheese factory and we are paid by the test. I am not satisfied with my tests and would like some information in regard to the subject of testing milk,

1. Does animal heat, if left in the milk, have any influence on the test?

2. Is the same amount of acid required in each sample of milk regardless of the conditions of the milk?

3. If cows are milked very early and late so that they give two-thirds of the milk in the evening, is it an unusual thing for this morning and evening milk to vary one per cent?

4. Can you burn the butter fat in the sample by using too much acid?"

Browntown, Wis. J. D. M.

1. I have never heard before that the animal heat in milk has any effect on the test. I do not see how it is possible for such a thing to influence the test and do not believe that it is worth considering. Very soon after milking the milk cools down to the temperature of the air, and it is usually not warm enough to have any influence on the test. If, however, the milk is very warm, having a temperature somewhere between eighty and one hundred degrees, this may make the action of the acid on the milk so intense that the fat, when it is separated, will be somewhat burned and have black specks mixed through it. This may be avoided in such a case by simply cooling the milk so that it has a temperature near sixty when the acid is mixed with it.

2. The same amount of acid is ordinarily used for testing all kinds of milk. There is no objection to this when the acid is of the proper strength. If it is a little weak, good tests may be obtained by using a slight excess of acid; when the acid is too strong, use less than the 17.5 c. c., measured by the acid cylinder.

3. I do not think there is often so much difference as one per cent between the test of morning and evening milk, when it is a mixture of the milk from a herd of cows. The difference in test of morning and night's milk is influenced mostly by the length of time between milkings. At some seasons of the year cows are milked very late at night and early the next morning so that through the night there may be only about ten hours between milkings, while through the day the cows are in pasture fourteen hours between milkings. This difference in time will have some effect on the test of the milk, the higher tests usually being found in the smaller quantity of milk, which in this case is the morning's milk. Such a variation as this will be greater in the milk of single cows than in the milk of herds. This is due to the fact that some cows are very sensitive to surroundings, and their milk test responds to the changes which may happen, such as weather conditions and rough treatment.

4. The butter fat in the test may be burned by using too much acid. This is due to the strong action which the acid has on the fat. The quantity ordinarily recommended is about right for dissolving everything in the milk but the fat, without attacking the fat in any way, but when more acid than this is used, the fat itself is partially charred by the excess. It is such an easy matter to get acid of the right strength (sp. gr. 1.82) that there is no good excuse for any one having tests that show burnt fat in them.

E. H. FARRINGTON.

Wisconsin Dairy School.

As to Oats and Cow Feed.

ED. HOARD'S DAIRYMAN:—In your answer to J. A. S., on page 570, you say that you are beginning to think that oats are too expensive to raise for horse feed.

I always imagined that an intensive dairyman like yourself depended mostly on oats as concentrates for his cows. I am very young in the cow business, but am in it to learn, and want to get the most advanced ideas on everything. Your answer as above stated, struck me as though you must have some different way of feeding and raising feed than the ordinary dairyman, and therefore would appreciate it very much if you will outline, showing what you grow mostly for cow feed, and in what way and manner you are feeding it.

You may think that I want to pry into your private business. I will leave that for you to decide. Your answer to my questions I am sure will be much appreciated by many of your readers, as a great many rely very much upon your action and practice. W. W.

Woodland, Wis.

The editors of HOARD'S DAIRYMAN have never fed oats as a part of the ration for milch cows, because, in their opinion, other feeds were considered more economical. In an experiment conducted at the Wisconsin Station, oats proved to be 10% more valuable, pound for pound, than bran for producing milk. An experiment at the Colorado Station showed that there was no practical difference in feeding value between Colorado oats and Colorado bran. Theoretically, oats contain about 66% of digestible nutrients as against 58% in bran. This would give oats a trifle more than 10% higher feeding value than bran for milch cows, but almost invariably, in this part of the country, at least, oats are worth in market from 20% to 25% more than bran.

In answer to the inquiry as to what the editors grow for cow feed, and in what way and manner they are feeding cows, we may say that we are more and more convinced that for the latitude and climate of Wisconsin, corn for silage and alfalfa for hay must constitute the greater part of the home-grown ration for cows. To this may be added for grain, either bran and barley, or barley and gluten feed, or distillers dried grains, or whatever else the market makes most profitable to use.

A Bit of Good Experience and Reasoning in Calf Feeding.

ED. HOARD'S DAIRYMAN:—While I never felt like taking issue with "the authorities" about feeding calves, it was always a mystery to me why oil meal, hay-tea and other foods rich in protein were recommended as substitutes for the fat taken from whole milk. 'Tis pretty easy to imagine that whole cow's milk is pretty nearly an ideal calf food—a well balanced ration. After removing the greater part of the fat the nitrogenous ingredients of the milk are certainly in excess. Then to add such foods as mentioned to the skim milk only makes matters worse. Acting upon this theory the writer determined to substitute flax seed meal for oil meal. This, it seemed, would in a measure at least, take the place of the fat removed by the separator and make a feed more nearly like whole milk. The flax seed meal was made into a thick jelly and added to the separator milk, which had been previously warmed to 98° to 100° according to the weather, at the rate of about one-half tablespoonful at first for each calf.

This quantity was gradually increased as the calves grew older.

I made no comparative tests to determine the relative value of the different feeds, but out of a bunch of 50 or more calves, we lost none and all kept thrifty with little trouble with scours, etc. Each calf got from three to four quarts of separator milk twice a day. We had to vary the quantity slightly to be able always to supply our customers with milk. Each calf was fed separately in a pail which was washed and rinsed in hot water after each feed. The milk was not poured into a long wood trough, and the calves, strong and weak, fast drinkers and slow drinkers, allowed to fight it out among themselves. Such a trough after several week's use during the summer would be a revelation to a tan yard dog. But I did not start out to tell how some other folk feed calves. I should like to know if I fed those calves as I ought.

They grew well and kept thrifty, but the question is, might different methods have produced better results.

Mich. J. D.-PRICKETT.

Location of Barn Buildings.

The report of the Illinois Experiment Station for 1903 contains some valuable material on dairy conditions and suggestions for their improvement. The location of barn buildings is discussed and cuts showing favorable and poor locations re given as follows:

In the production of clean milk no one thing is of more importance than keeping the cows out of the mud. Many yards into which dairy cows are turned each day for their drink and exercise, are knee deep with mud and manure during the winter and spring, if not nearly the entire year. In summer when the cows are on pasture they would keep comparatively clean were they not obliged to wade through a filthy yard in going to the stable.

In locating a dairy barn care should be taken to have a gentle slope from the barn in at least one direction, affording good natural drainage for both barn and yard. If the barn is already built and poorly located, draining and grading will do much to remedy the evil. In most cases it would take but a small amount of labor with plow and scraper, when the ground is in suitable condition to handle, to give the surface of the yard a slope from the barn sufficient to carry off the surface water. Even if dirt has to be hauled in from outside the yard to accomplish this, it will not be expensive. Tile drainage alone under a yard is not sufficient as the tramping of the cattle soon puddles the surface, preventing the water from passing down to the tile.

After the grading is done the yard should be covered with gravel or cinders. By putting the coarser in the bottom and the finer on top, a good hard yard can be obtained and at a comparatively small expense where material of this kind is available. If this cannot be done in one year, it is of the utmost importance that a beginning be made by grading and gravelling a portion of the yard next the barn, so that the cows may have some place on which to get out of the mud and filth. By grading a part of the yard each year and applying a thick coat of gravel or cinders to the graded part, the entire yard will, in a few years, be in good condition. When gravel does not contain enough clay to pack hard, a small amount of clay should be mixed with the top layer. It will then form a firm surface.

A Poorly Located Barn. The pond should be drained and barn yard graded to slope gently from the barn.

A portion of the yard should be bedded, thus affording the cows a place to lie in the open air on pleasant days. If straw is scarce the cleanest of the soiled bedding from the stable will answer for this purpose. When the straw and manure on this bedded portion of the yard become too deep and soft, it should be hauled into the field and the bedding commenced again on the solid yard.

It is advisable to haul the manure directly to the field from the barn, but if this is not feasible, it should be removed at least 100 feet from the barn. In no case should it be allowed to accumulate against or near the dairy barn and no swine pen should be nearer then 200 feet on account of the odors being readily absorbed by milk.

A Well Located Dairy Barn.

Making Firm Bacon.

Prof. J. H. Grisdale, of the Ontario Experimental Union, who has conducted many experiments in order to arrive at satisfactory conclusions as to the proper methods of producing firm bacon, said in a recent address:

The feeding of pigs for the production of first-class bacon is an art which it is hopeless to attempt to discuss profitably in ten minutes. There are, however, certain feeds, certain requirements, and certain conditions which influence more or less strongly the quality of the product, so far as firmness is concerned, and to these I would direct your attention.

To begin, let me urge that those who confound "soft pork" with "fat pork" disabuse their minds of this mistake and remember always that the "fat hog" is the "firm hog" quite as frequently as is the hog that bears a thinner layer of fatty tissue.

Yet, again, do not infer that certain breeds always produce "soft pork." So far as breed influence on firmness is concerned I think I am right in saying that any one of the common breeds is as good as any other of the same. Some breeds, such as Duroc Jersey, and Poland China, doubtless tend to produce short, thick sides. These may, however, be quite as firm as the most perfect Wiltshire side ever grown.

The influence of locality or climate is one that has come in for more or less consideration, but so far as we can ascertain by experiment, is a factor of very small importance; in fact, quite negligible, save in so far as it influences the kind of food fed the pig. Certain sections are noted for a good quality of bacon, but doubtless because of certain feeds peculiar to that district, while other sections produce large quantities of soft pork, no doubt because of certain feeds commonly fed there.

The most common causes of soft pork, so far as we can find out by experiment, observation, and inquiry, are:

1. Feeding pigs too rapidly from birth to the required weight. This rushing process, while it does not always give bad results, frequently produces soft sides, and not seldom are the carcasses both "soft" and "thick."

2. "Feeding off," or rather, selling when under weight or before maturity, our experiments have shown very clearly, is the one almost certain indication of softness. Generally speaking, also, the degree of immaturity may be taken as the measure of the softness; that is, the further from maturity, the softer the flesh is likely to be.

3. Improper feeding. Pigs fed on any ration not conducive to health, or fed in any way not favorable to thriftiness, are almost certain to yield a large percentage of "softs" while properly fed hogs will yield a high percentage of "hards." In brief, I think I am perfectly safe in saying that 99 per cent of properly fed and properly cared for pigs will produce firm meat.

Properly cared for pigs means pigs under conditions conducive to health and thrift. Airy, roomy, light quarters are the right sort. If space is an expensive consideration, as it usually is, especially in winter, then let the small space be well ventilated, well lighted and kept clean. Large runs are not necessary where the other conditions are provided.

Feeds.—The most important factor in the production of firm bacon is, undoubtedly, the food.

The preparation is, apparently, a matter of minor consideration so far as influence upon firmness of flesh is concerned, save in so far as it affects the health of the animal.

The rate of feeding is of more or less importance, as indicated above, since "rushed" pigs produce more or less "softs."

The kind of feed is the thing. Corn fed alone produces a very large percentage of "softs." Corn fed with a small proportion of skim milk or whey gives much better results. After the skim milk or whey constitutes 10 or 15 per cent of the dry matter of the ration, the proportion does not appear to greatly matter. Just incidentally, the addition of such an amount of skim milk or whey cheapens production materially. Roots, clover steamed or green, rape or grass may take the place of skim milk with corn and give results nearly as good. A small proportion of corn with the cereals, oats or barley, or with peas, does not appear to have a very injurious effect.

Barley is unsurpassed as a feed for the production of firm bacon. Oats, also, are most excellent. Peas produce good results, and mixed with other grains are exceedingly valuable.

In conclusion, skim milk or whey are almost infallible guaranties of firm pork. The cereals and peas properly fed constitute an almost faultless ration. Corn may be fed, but must have some counteracting food along with it or it will give bad results.

Handling Clover Seed.

ED. HOARD'S DAIRYMAN:—Noticing your article, "Handling Clover Seed," page 570; clover seed does not shell, but the heads break off, and no crop needs careful handling more than clover seed. Cut it with self rake reaper and when dry take it up with barley forks. Don't tramp around much on the load. Cover the stack with boards. G. H. S.

Dane, Wis.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

White Specks in Butter.

For some time past we have found small white specks in with the butter after churning. They resemble broken bits of chalk, being perfectly white, but mash easily in the fingers into a dry paste. There is a wide variation in the amount of this foreign matter present in different churnings. A. B. C.
Pattsgrove, Pa.

The white specks may be due to two causes: First, allowing the cream to dry on the surface, and round the edge during ripening, and second, allowing the cream to become over ripened. The dried cream forms small lumps of casein which do not break up during churning and show white in the butter. The excess of acid formed from over ripening, throws the casein down in lumps which also show as soft, white bits of casein in the butter. The first trouble can be prevented by covering the cream during ripening and the second by churning at shorter intervals. Cream should never be allowed to get over ripened, as the butter from such cream is always of low quality.

A Silo Query.

I would like to ask which would be the best for silo, 2×4, or two thicknesses of flooring with paper between. J. B. P.
Ada, Mich.

If one is building a stave silo, he better use the 2×4 lumber rather than the two thicknesses of flooring.

Butter from Cream of Different Percents of Fat.

Will yon tell me through your paper how much butter 15, 20 and 25 per cent cream will make?
N. Hannibal, N. Y. E. A. P.

Counting the overrun at 18%, 100 lbs. of 15% cream will make 16.7 lbs.; 20% cream, 23.6 lbs.; 25% cream, 29.5 lbs. of butter. The above figures are merely approximate, depending on the thoroughness of churning and working the butter. The creamery results may be a little over or under the above figures.

Buttermilk for Swine.

Can buttermilk be fed to hogs to advantage? If it can, please reply, stating the best way. Age of hog best adapted. Would you use any grain, or allow hogs to run to clover? E. B. S.
Winona, Minn.

Certainly buttermilk can be fed to hogs to advantage, but for the best profit, there should go with every 3 to 5 pounds of the buttermilk, one pound of grain, preferably wheat middlings or ground corn. Thus fed, a hundred pounds of buttermilk is worth half as much as a bushel of corn. The greatest profit in feed of any kind comes from feeding it to young animals, whether calves, lambs or pigs. A clover pasture is always in order for swine of any age, but clover and buttermilk would not make the most profitable combination. Add the middlings or corn.

The Babcock Test.

Would like to ask a question. Can an unexperienced person obtain good results with the Babcock tester? Is there any danger with handling the acid? Where can I obtain a bulletin on the Babcock tester? Wm. J. M.
Pleasanton, Kans.

If the user will follow carefully the directions sent with the test there will be no difficulty in testing milk accurately. The acid used is a strong corrosive and will eat clothes or flesh if allowed to come in contact with them, but there is no danger with careful handling. Send to the Wisconsin Experiment Station for a bulletin on the Babcock test.

Regarding Mr. Grote's Rations.

Ed. Hoard's Dairyman:—I was interested in Mr. Grote's caustic criticism of your "two, positive assertions," as he terms them, as contained in the communication entitled: "Continued Discussion," as published in your issue of July 24th, and his great magnanimity as shown by the statement that if the editor would acknowledge he was wrong and apologize the controversy would be ended.

Now, there is not a practical dairyman of experience but what knows that every word contained in the two quotations is strictly true in every sense. A deep milking cow will not eat enough of roughage or ordinary fodder, as contained in the rations submitted by him, especially the last two to keep her full flow of milk, but will shrink every time unless fed some of the more concentrated foods. I have proved this to my own satisfaction, more than once, by actual experiment and experience.

I commenced peddling or delivering milk in 1863 and have had charge of some of the best dairy herds in Maine and Massachusetts since that time, and have been quite a close observer, and my experience has been invariably that one-half of the quantity of coarse feed with the equivalent in value of the other half in some good concentrated food like gluten meal, cotton seed meal fed in connection with good wheat bran, will give better results in every way—more milk, more cream, better condition of stock. In other words, I had rather have five tons of good hay with the equivalent of five other tons value in bran, cotton seed meal or gluten feed, than ten tons of the best hay that was ever fed by itself; and when you go to substitute marsh hay, oat straw, rye straw or fodder corn, the idea is simply preposterous. If any one doubts this, let them try the experiment of feeding this roughage as enumerated in the first assertion, or clover silage and clover hay alone as contained in the second assertion, and change to feeding one-half the value in some concentrated food and he will not be long in doubt as to which is the most palatable to the cow and gives the best results as to filling the milk pail. Then let him leave off the grain ration and feed his roughage or dry hay, or even silage, and see how quick he will note the difference in the flow of milk, and how quick old Mooley will call for her grain ration. This, as I understand it is, just the point contained in the articles specified and Mr. Grote in his last article is neither fair, honorable, nor just in his criticism.

The editor of the Dairyman has never said anything adverse to raising all the soiling crops possible upon the farm, both for green soiling and silage. On the contrary, has always advocated and urged it, as no one knows better than Mr. Grote does. But the point of the whole matter is, the editor believes that when pastures become dry and dead and we all have to fall back on hay, silage, corn fodder, etc., a good grain ration does fill the bill, helps fill the milk pail as well as the purse, and I venture to say this is practiced by more than nine-tenths of the thoroughly up-to-date practical dairyman throughout the land. When he states the editor insists upon purchasing grain or

"ADVERTISEMENT".

A BACK NUMBER.

The Milk and Egg Diet.

Starving the patient who has a sick stomach, is an out of date treatment and no longer necessary with the predigested and nourishing food Grape-Nuts that the weakest stomach can handle and grow strong upon.

There is plenty of proof of this: "I had suffered from stomach trouble for six years and for most of the last two years had been confined to my bed, the trouble having become chronic in spite of the very best medical attention. I had always been a coffee drinker but for the past year I could not drink it at all because it made me so nervous I could not sleep and my appetite was almost entirely gone.

Then some friend advised me to try the predigested food Grape-Nuts and about three months ago I did so and since that time my improvement has been so rapid that my customers and friends are astonished and every day someone remarked upon my changed condition. I have gained 15 pounds, sleep well, my appetite is good and my digestion is perfect. Where I have lived on milk and light diet for years I now eat most anything I want and don't suffer any inconvenience either. The way Grape-Nuts food has built up my stomach and strengthened my nervous system particularly is just wonderful.

I drink your food drink Postum too and no longer feel the want of coffee. There is absolutely no doubt that leaving off coffee and using Grape-Nuts and Postum has brought me out of my bed from an invalid back to fine health." Name given by Postum Co., Battle Creek, Mich.

"There's a reason" and that reason is plain to anyone who will spend a few minutes investigating in the interest of health.

THE U. S EXCELS ON ANY TEMPERATURE.

Our "would-be competitors" the DeLaval Separator Co., finding themselves badly beaten in the six weeks' tests of six different makes of Separators at the Kansas Agricultural College, as shown by the official Bulletin No. 123 issued May 26, 1903, in their efforts to break the force of so disastrous a defeat, have compiled a Bulletin of their own "getting up" purporting to be signed by several students, in which they try to make it appear that the DeLaval was not terribly beaten, as the Official Bulletin shows it was as follows:

Average test of skimmilk of DeLaval Separator	**.048**
" " " U. S. "	**.033**
U. S. excels DeLaval	**.015**

Showing that the DeLaval Separator left 45 per cent. more butter fat in the skimmed milk than the United States.

Again in this "gotten up" Bulletin, our "would-be competitors" state that the U. S. Separator "choked up" on 39 lbs. of milk at 70 degrees of temperature and that the DeLaval ran 80 lbs. Every dairyman using a U. S. Separator knows that the U. S. will not "choke up" on 80 lbs of good milk at 70 degrees, and that such statements are made in an attempt to break the rapidly gaining popularity of the

U. S. SEPARATOR.

We make the following proposition to any dairyman wishing to buy a separator, viz.: We will put a U. S. Separator into his dairy and agree that it will not "choke up" on 80 lbs. or twice 80 lbs. of milk in good condition at 70 degrees, provided he will pay for the separator if it does not "choke up."

The best authorities do not advocate separating at 70 degrees, but if Dairymen prefer to, the U. S. will do it when properly adjusted.

The U. S. Separator skims cleaner than any other separator on the market at any temperature from 70 degrees to 156 degrees at proper adjustment. The Official Bulletin No. 123 of Kansas Agricultural College, dated May 26, 1903, states that

The U. S. Excelled all Others in tests of Skimmed Milk and in Minimum Total Loss.

THE U. S. SEPARATOR HOLDS WORLD'S RECORD.

STAR MILK COOLER CO., Haddonfield, N. J.

EASY. It is easy to go on losing money by taking care of milk in the old way, that is, by not taking care of it: But it is easy, too, to take proper care of your milk with a

Champion Milk Cooler-Aerator

The Champion is pre-eminently the easy Cooler—easy to buy, easy to take care of, easy to use.

A Booklet for the asking.

Champion Milk Cooler Co.
67 Main Street, CORTLAND, N. Y.

concentrated food, he is not treating the question fairly or honorably as nothing was mentioned in the articles of the kind.

A word as to the cost of the rations enumerated by him and I will close.

In Nos. 1 and 2, he chooses timothy hay, which everyone knows is not a good milk producer, but in his rations is particular to include silage and alsike hay, but let that go and let us see what his rations would cost here in Massachusetts and how his theory would apply here. During the past year, good average feeding hay has been bought for $16 to $20 per ton; swamp or marsh hay, $10 to $12; call it $16 and $10. Conservative men estimate 3 pounds silage equivalent to 1 of hay. Estimating on this basis, how does it stand?

40 lbs. corn and bean silage=13 lbs. hay	.08
10 lbs. fodder corn	1
5 lbs. marsh hay @.005	2.5
5 lbs. soy bean straw	1
1 lbs. soy beans	2
	14.5

No. 2.

Substituting alsike for marsh hay, add	2
	16.5

No. 3.

40 lbs. cow pea silage	8
10 lbs. alsike hay	8
10 lbs. fodder corn	1
	17c

No. 4.

40 lbs. corn and cow pea silage	8
10 lbs marsh hay	5
10 lbs. fodder corn	1
1 lb. soy beans	2
	16c

Nos. 5 and 6 are not deserving of consideration, for you would not get enough milk to pay for labor of feeding and milking, and no dairyman of average common sense would think of feeding same unless he wished to dry them off. So let every good, sensible, up-to-date farmer raise all the good silage (the more ears of corn in it the better for the grain), he is capable of doing, with peas and oats, soy beans and cow peas, Hungarian and millet and fodder corn for green soiling; and when you see the milk supply falling off, give your cows a good, fair feed of bran and cotton seed, or gluten, and see how quick old Mooley will appreciate it and respond by increasing her flow of milk.

Remember one thing: It is the good, generous feeder that gets the best results every time, and the better the feed the better the results. D. C. K.

Spencer, Mass.

Accurate Records Better than Guess Work.

Peas and Oats and Pea Vines for Silage.

ED. HOARD'S DAIRYMAN:—Will you please sent me 4 or 5 dozen sheets of your paper for 10 cows to keep the milk records. I have weighed my milk for 2 years and I find I know when a cow pays better than by the guess plan.

It was dry here until July 1st and since then it has been quite wet. Most of the crop looks pretty well. I was by one piece of peas and oats today that are very stout and thought if we had a silo and could put them in with safety, what a lot of splendid feed we could have next winter. We raise lots of potatoes in this county, but it is a hard, uncertain business, there is so much to contend with—bugs, rust, weeds, rot and help, so I have a few cows to help me out.

Mr. Goodwin has put in a pea canning factory and I suppose there will be lots of pea vines for the silo. Will they keep all right? Your paper is a help to me and I hope to get more good as the days go by. F. E. D.

Caribou, Me.

Peas and oats and pea vines make good silage, and we have reports of very excellent success with them.

It is a great mystery to us why thousands of other dairymen do not keep accurate records of the milk yield of their individual cows. It has been demonstrated over and over again that even the most careful dairymen, and the best judges of cows, are frequently deceived. Even so careful and exact a man as Mr. Gurler, of Illinois, after taking extraordinary pains to weed out all the poor cows, in a lot of fifty found four that brought him in debt for feed and labor. The average profit for these fifty cows was $19.98 each, but among the number there was one in debt to him $11.00, another $6.80, another $5.34, another $1.15 and one other made a profit of only 44 cents, while the four best cows in the lot made an average profit of $53.77 each.

We venture to say that there is not one herd in ten, where there are twelve or more cows, that does not have one or more cows that it would be profitable to kill outright. Excellent spring balances can be bought for $5 or less, and the time required to weigh the milk, both night and morning, is less than one minute per cow. Who is there then that cannot afford to keep records?

Cement Bottom for Silo.

ED. HOARD'S DAIRYMAN:—In the DAIRYMAN of July 31st. F. E. D. is advised that it is quite possible to build the bottom of a silo in wet ground, of cement, to keep out the surface water. I know that cement reservoirs are built in the ground and where the supply of water is ample, the seepage through the cement does no harm. Cement will absorb water the same as brick. I have seen it tried to build a vault in the ground of cement to keep the water out. In less than a week the water rose in the vault so it was 2 feet deep and on a level with the surface water in the earth.

My house has a cellar full size of house. The foundation at bottom of cellar is a cement wall 12 inches high. On this are 2x4 studding sheeted with inch boards on the outside. Outside of these boards is a 3-inch wall of cement. The cement wall is painted with asphaltum, then the earth is graded in so the yard slopes away from the house. The dampness from the earth does not seem to affect the wooden part of the cellar wall.

Pentwater, Mich. S. E. R.

Butter Makers Attending the Sioux Falls Convention.

ED. HOARD'S DAIRYMAN:—All Wisconsin butter makers who intend going to Sioux Falls to attend the National Convention, will confer a favor by sending a postal card notice of their intention to the undersigned, before Sept. 1, 1903.

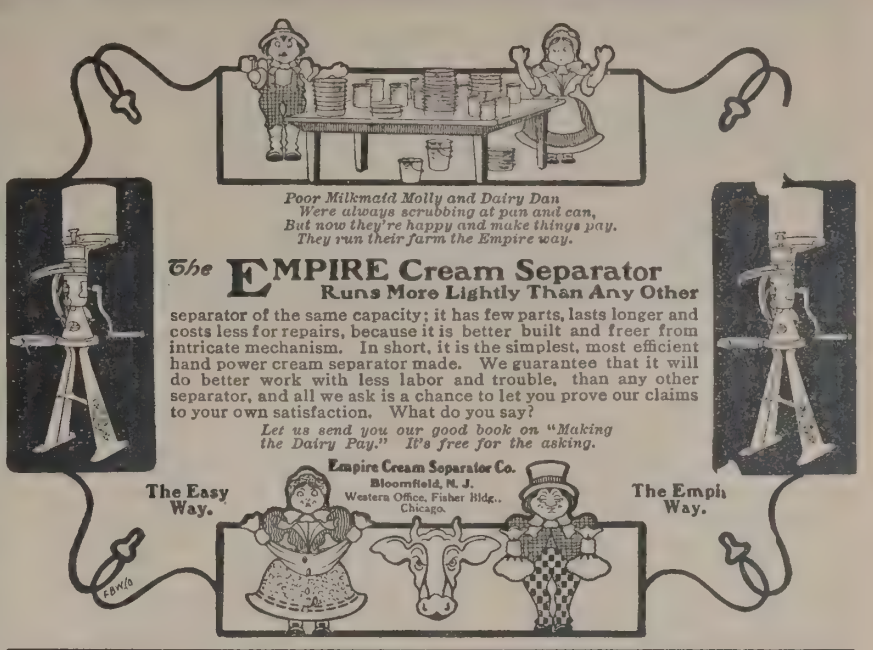
CAN'T HELP IT

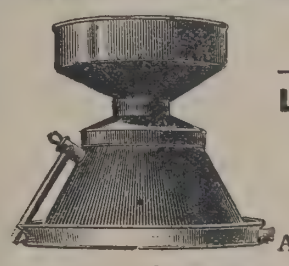
Coffee Nerves Always On Edge.

The easy way to get rid of coffee nerves on edge is to quit the coffee and drink well made Postum Food Coffee in its place.



When the Postum is thoroughly boiled it furnishes a rich tasting food drink and it is then easy and pleasant to shift from the drug to the food coffee.

A Washington lady says: "For a long time I suffered so from nervous headache and was so weak and worn out all the time that I was hardly able to do my housework. Every little thing worried me so, and the noise of my two little children almost drove me wild. I tried my best to be kind and patient with them but it seemed the harder I tried the crosser I grew until I was discouraged almost to despair. I had been using coffee three times a day for about 12 years. Several months ago I read an article in a religious paper telling about Postum Food Coffee and I made up my mind coffee was causing my trouble.



"So I shut down on the coffee, which was easy when I used Postum. My headaches grew more painful at first but I was not surprised at this and was determined to let coffee alone and give Postum a fair trial. In a few days Postum had driven most of the drug effects of coffee out of my system. The headaches grew less and finally stopped altogether and for the past three months I have been a different person. The headaches are all gone, my strength is coming back, nerves are steady and I feel rested in place of tired all the time.

"I know it was coffee that caused all the trouble and I am certain that Postum is rapidly repairing all the wrongs that coffee caused. I always tell people when recommending Postum to be sure to make it according to directions; don't forget to boil it fifteen minutes." Name given by Postum Co., Battle Creek, Mich.

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

NEW YORK MARKET.

NEW YORK, Aug. 8—Butter—Receipts for the week, 59,662 packages.

All fresh creamery butter was in quick demand extra sold to best trade at 19¼@19½c, and out-of-city dealers were liberal buyers of all grades creamery at prices ranging from 17 to 19½ cts, and the market closes firm with many orders going over unfilled on account of scarcity of fancy, fresh goods. New York State dairy was mostly of inferior quality, and sold in lots at 15@17 cts, with a few fancy selected tubs selling at 18@19 cts. Low grades butter are dull and prices nominal. We quote:

Creamery, extra, 19@19½c medium, 17½@18¼c; poor, 14@17c; Dairy, extra, 18½@19c; medium, 15@17c: poor, 12@14c.

Cheese—Receipts for the week, 33,918 boxes. Exports, 2,814 boxes

The market is about the same as last week. Trade was active and receivers had no trouble disposing of fancy cheese on arrival at full prices: we quote sales of finest, small cheese at 10⅝@10¾ cts, and large ones at 10¼@10½cts. With stocks all taken at the close. Skims were not so quick as last week. prices were easier and some stock goes over unsold. We quote:

Full Cream, small, extra, 10⅝@10¾; medium, 10@10½; poor, 7@9c. Full cream, large, extra, 10⅜@10½c; medium, 10@10¼c; poor, 7@9c.

Eggs—Receipts for the week, 51,949 cases.

Not enough new laid eggs arriving to supply the trade, this style of egg is wanted and buyers are willing to pay the advance. Poor stock and so called fresh eggs taken out of freezers are in full supply and regular prices.

New York & Penn., strictly fresh, per dozen, 21@22c; Northern & Western, strictly fresh, 20c: all Sections, poor to good, 14@19c.

177 Chambers St. DAVID W. LEWIS & Co.

LIVERPOOL, Aug. 10 —Butter—Good United States steady, 75s.

Cheese—American finest, white quiet, 46s.; colored 47s. 6d.

BALTIMORE MARKET.

BALTIMORE, Md., August 6—Butter—Favorable weather for butter making and continued liberal receipts have had a rather depressing effect on the trade in general, hence we cannot see but little if any change in the condition of the market as noted in our last issue. Extras and firsts continue in fairly good demand, particularly long lines, while seconds are in heavy supply and there is very little inquiry for them at all. Imitations. while in moderate receipt, the supply of the kind is ample for the requirements. Ladles are in fair receipt; the arrivals show the usual variation in quality at this particular season, hence the wide range in values. Packing stock: while in less liberal receipt, the supply is about equal the demand, which is confined almost exclusively to fresh sweet stock; all defective lots are slighted. Blocks and prints while in quite liberal supply, all desirable invoices meet prompt sale. At the close of the general market today, there was a moderate trade, but it was limited (with but a few exceptions) to the local consumptive demand; the prices on the finer grades rule steady, while under grades are moving out slowly at uncertain values.

Creamery Separator, extras, 19½@20c; firsts, 18½@19c; seconds, 16@17c. Imitation Creamery, extras, 18c; firsts, 17@17½c. Creamery blocks (2-lb.) extras, 21c; firsts, 19@20c; seconds, 17@18c; Creamery prints (¼ lb) extras, 21½@22c; firsts, 20@21c; seconds, 17@18c. Md. Va., & Penna. Prints, extras, 20c; firsts, 18@19c; seconds, 15@17c: renovated extras, 18@19c: firsts, 16@17c, seconds, 15c.

Egg--There are but few strictly fancy eggs arriving in the current receipts; all offerings of this description meet quick sale at 17⅛ cents, while the supply of heated and other defective stock is ample for the requirements; prices are governed entirely by the quality of the stocks, hence the wide range.

Cheese—The receipts are ample; demand very moderate; market quiet.

N. Y. State—Cheddars, fine, 10¾@11c; choice, 10¼@10½c; fair, 9@9¾c, Flats, fine, 10¾@11c; choice, 10¼@10½c; fair, 9@9½c; Small, fine, 11@11¼c; choice, 10½@10¾c: fair, 9½@10c; Ohio Flats, fine, 9¾@10c; choice, 9@9¼c; fair, 8¼@8½c; O. Picnic, fine, 10@10¼c; choice, 9½@9¾c; fair, 8½@9c; Swiss Cheese, (domestic) new. fine, 13@13½c; choice, 11@12c; fair, 9@10c.

Flavor

The market value of butter is unquestionably its flavor, and its flavor is unquestionably affected by the quality of the salt used. Prize winning butter makers always use DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—to insure that *winning flavor*. Its pure, dry flakes quickly dissolve—assimilate *evenly* through the butter, and add a keeping quality that is inestimable. No waste—no grit—no mottled effect. The only salt in the world that's all salt. Dairymen will find our illustrated booklet "Just Salt" contains valuable hints. We send it free.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

AS USUAL IN SCORING CONTESTS

WORCESTER SALT WINS

A six months' scoring contest recently concluded in Michigan, under the auspices of the State Agricultural College, was won by the Lotus Creamery Co. of Vicksburg, whose letter we quote:

"VICKSBURG, MICH., 6-1-03.

"WORCESTER SALT CO., NEW YORK.

"DEAR SIR: We are very much pleased over the idea that our buttermaker stands at the head in Michigan.

"We used Worcester Salt in the butter scored in the contest and are so well pleased with its qualities that no other salt stands a show with us.

"Mr. Stafford claims that the ease with which it dissolves, and its even strength and purity, make a vast improvement over other salts tried in rendering a good butter flavor.

[SIGNED] "Yours truly, O. O. BISHOP, Secretary."

Mr. Stafford is added to the long list of buttermakers who know

IT TAKES THE BEST TO MAKE THE BEST

For rates tickets, etc., apply to agents Chicago & North Western R'y. 26-3

"Dog-Days" and Cream Separator Fakirs

Every "dog-day" season one of our old time "tin-can" creamer would-be competitors, of late years making a separator of which it is said that its only good feature is its sacrilegiously taken name—the "U. S."—, is seized with a new advertising spasm of some kind and a desire to buy newspaper space for use in imaginary self-comparison of itself with the DE LAVAL, in which new fake it usually grows worse from week to week until the DE LAVAL stoops to notice its fairy stories.

First it was so-called Experiment Station fake "skim-milk records"; then a false representation of a Paris Exposition award and a still more false one of the DE LAVAL machines not having received the Grand Prize; then a garbled report of the Buffalo Exposition skim-milk tests and much lying about the awards made there. And so it has gone for some years.

Now the latest fit of rabies of which this disciple of Ananias is the victim is brazenly advertising that his machine can't skim cool milk because of quickly clogging up with it, while he pleads that it is wickedly cruel of the DE LAVAL agents to remind buyers of separators that there are frequent occasions when this is both convenient and necessary, and that the practical separator must be capable of it, though only the DE LAVAL is with good results.

Those who may read the advertisements of our envious little "teaser" should always keep these fundamental facts in mind: The DE LAVAL machines received the only Regular Award at Chicago, the only Grand Prize at Paris, and the only Gold Medal at Buffalo. They have done the best work and are held to be the best separators in every Experiment Station in Europe and America. They are used by 98 per cent. of the experienced creamery users of separators throughout the world—and their sales are ten times all other makes combined, while with a 50 per cent. greater output every year for twenty years there has never been a year yet in which the DE LAVAL manufacturers could meet the demands upon them.

This is a record of stone-wall facts which any of our pigmy would-be competitors are perfectly welcome to stand up and measure themselves alongside or butt their shortcomings into whenever they may be foolish enough to attempt it.

If any reader may not understand why a DE LAVAL SEPARATOR is as much better than the best of its imitators and followers are better than gravity systems a DE LAVAL catalogue to be had for the asking will make the reasons plain.

A Model Dairy Barn.

(Continued from page 607)

floor, connected by a pipe which carries away all impurities in the atmosphere.

While the cow stables are one story high, with a high roof, and a row of ventilating windows in the top, the barn is two stories high. There are series of shutes through which the several kinds of food may be sent to the ground floor. There all the food is weighed and prepared. There is also a hospital room where an ailing animal may be kept and treated.

After the milking is done in the barn, the milk is taken to the creamery, a small building in front of the barn. Here again the floors are of concrete. The cement walls have received seven coats of paint, the last being enamel, and all the corners have been so rounded as to leave no lurking place for dirt or germs. The warm milk is poured into a separator and the rich yellow cream pours from the separator into scrupulously cleaned tin vessels which are transferred to a refrigerator where they are kept until the cream is ready for the churn or the market. The skimmed milk gushes from another spout and is kept separate. In the creamery is another mysterious machine, called a tester. About one gill of milk from each cow is poured in a bottle and the bottle placed in the machine. Some acid is added and when the electric current is turned on the machine sends the bottles whirling with amazing speed. The quality of the milk, just how much butter fat and other products, is accurately determined.

A big sterilizing oven is also a prominent fixture. Here all of the vessels used in the creamery are placed and steam heat from the engine is turned on. The oven attains a heat of 250 degrees, sufficient to kill any stray germ that might have fastened on any part of any vessel.

All of these buildings and their equipment are merely preliminary, however, to the great test that will be made at St. Louis during the exposition, Mr. Graves has had an architect draw plans for a stable that is to be built on the World's Fair grounds, that will be the home of the Jerseys until the close of the exposition. This stable will embrace all of the improvements tested at Jerseyville, and more. The same sanitary precautions will be taken, the floors, stalls, gutters will be modeled after those of the Jerseyville stable. The World's Fair stable, however, will be octagonal, with the stalls in a circle around the office of Mr. Graves and the room where the testing and measuring will take place.

In all former dairy tests at international expositions the stables have not been open to the public. Here a 15-foot promenade extends almost all around the stalls, and the visitor may see each one of the cows entered in the test as she stands in the stall. The animal will face the visitor, and her name and pedigree may be learned. Besides the 25 cows entered in the test, there will be a reserve herd of 15 cows, and some of the most valuable Jersey bulls in the world. The bulls and some of the cows will be kept in box stalls. A wire netting, extending to the ceiling, will separate the public promenade from that part of the stable where the cows are confined. No one will be permitted behind the screen save those connected with the exhibit, and the judges.

Every ounce of food given each cow will be carefully weighed and a record kept. This is also true of the water drunk by the animals.

A large silo will be built adjoining the stable. This will be round, 18½ feet in diameter and 40 feet high, built of California red wood and will hold 200 tons of silage, which will be fed during the test. A field of 20 acres of corn is growing on a farm near Clayton, Mo., and in August this will be cut and taken to the World's Fair grounds, where the entire corn will be passed through feed cutters and pressed into the great silo. This will take the place next summer of the green food that the cows would get if they were on the pasture. Alfalfa for food will be brought from Colorado, and only the choicest meal and other foods will be fed.

All feeding and milking will be done in the stables, and the milk will be turned over to the Dairy Department, which will erect a model dairy in the Palace of Agriculture. Here the milk will be converted into butter and cheese, and a careful record of each cow's part in the test will be kept. Representatives of members of the Shorthorn, Guernsey, Holstein and other clubs will be at all times permitted to enter the barn and inspect it.

With the herd will be Flying Fox, the famous Jersey bull owned by Thomas W. Lawson, of Boston. Mr. Lawson paid $7,500 for the animal, and has refused an offer of $15,000 for him. Flying Fox Imported is another high grade bull that will be with the herd. This animal was born on the Isle of Jersey and is owned by H. N. Higginbotham, of Chicago, who was president of the Columbian Exposition. Another fine bull that is already with the herd, is Merry Maiden's Third Son, owned by H. C. Taylor, of Orfordville, Wis.

Among the prominent Jersey cattle breeders who have made entries, are C. I. Hood, of Lowell, Mass., and George Vanderbilt of the Biltimore, N. C., estate.

The following cows are already at Jerseyville:

Lady Perfection 2d, 128,278 and Harriet J. of St. Lambert 153,512, Frank J. Hart, Cleveland, O.

Lassie Easter Pogis, 143,523, H. C. Young, Lincoln, Neb.

East Lake Girl 121,127, R. A. Sibley, Rochester, N. Y.

Senone 14,523, Wm. Stupful, Council Bluffs, Iowa.

Aaron's Queen 155,591, July Blossom 2d, 137,680 and Adelphia Melia Ann 162,521, Frank B. Queeney, Belvidere, N. Y.

Loretta D. 141,708, F. H. Scribner, Rosendale, Wis.

Dorinda Darling 146,249, Wm. M. Clark, Lincoln, Neb.

Prize Mays Duchess 132,476, George H. J. Sisson, Jr., Pottsdam, N. Y.

Blossom of Florence 164,109 H. F. Probert, Jackson, Mich.

Zaza of Menlo 147,312 and Gertie Alexander 151,395, The Ladd Estate, Portland, Oregon.

Diploma's Brown Lassie 164,877, J. J. Richardson, Davenport, Iowa.

Chief's Rosebud 169,987, F. H. Olin, Perry, N. Y.

Bridget's Pride 121,466, Dr. R. W. Thomas, St. Joseph, Me.

Portia of Prospect 138,783, W. H. Silverthorn, Paynesville, O.

Very Much More 140,733, Ben Ames, Mt. Vernon, O.

Bea of Lawn 121,532 and Zelda of Lawn 134,153, A. O. Aulen, Evanston, Ill.

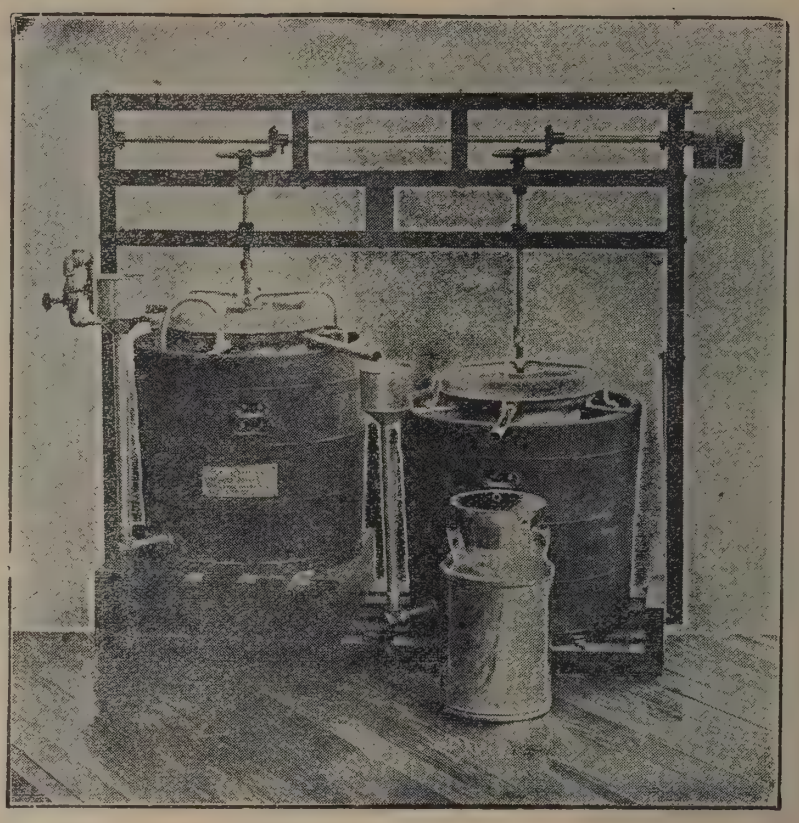
Seekonks Pride 134,309 and Millie au Claire, John F. White, Mt. Morris, N. Y.

The amount of money involved in this Jersey exhibit is enormous. Many thousands of dollars were expended in fitting up the preliminary home at Jerseyville, and a much larger sum will be spent in the construction of the permanent home on the World's Fair grounds at St. Louis. The feed for the cattle will cost another fortune. It would be hard to fix a value on the herd itself, but on the market it would bring more than one fortune. Mr. Lawson has refused $15,000 for the fine bull at the head of his private herd and many of the cows would bring fabulous prices were they placed on the market.

Some Milk Questions.

ED. HOARD'S DAIRYMAN:—I have just gone into the retail milk business, and if you will answer the following questions you will do me a great favor.

1. What gives milk the sweet, pleasant taste? I take milk of five farmers, and the milk that analyzes next to the lowest in butter fat and solids, is the sweetest and most agreeable to the taste, yet pretty poor in quality.



2. What do large cities in general do with their surplus milk? Here the farmers make too much milk in spring and early summer, and not enough later on. Who generally stands the loss, the farmer or peddler? I should think the farmers and peddlers would form a stock company and build a creamery and make into butter and cheese the surplus milk, and not force it on the market and thus cut prices in order to sell it, and, therefore, would like to know what is done in other places.

3. Is it an established fact that a cow will make as good milk on swale hay, as on the best of feed, the only difference being in the quantity?

4. Two of my farmers fed ensilage, and in March and April the milk had a bad smell and taste due to the ensilage. Could that be prevented?

5. What should be the size and cost of an ice house to properly care for the

Truth to Tell

There are no other milk cans made that can equal in wearing qualities the genuine

BUHL CANS

They are tinned to stay tinned, and put together to stand years of hard service. Other cans crack easily, become dented, and being lightly tinned soon rust and go to pieces. Not so with the "Buhl Factory," "Improved Elgin" and "Genuine Iowa." They will outlast any other cans on the market, and are thoroughly and quickly cleaned, **Remember**, the Buhl is the only can in the world that is made with the **Buhl "Victor" Can Breast** and the **Buhl "Victor" Round Handle.** As there are many inferior imitations of this can, we stamp all ours with the **Milk Can Trade Mark.** Look for it. Sold by all live dealers. Ask about them, or write us direct.

BUHL STAMPING COMPANY,
212 W. Larned St., Detroit, Michigan.

milk and for domestic purposes of a dairy of 30 cows?

6. Which is the best milk from a medical standpoint, the richest or the poorest, or some way between in butter fat, I mean 3, 4, 5, or 6% milk?

Worcester, Mass. A. D. P.

Milk has a sweet and pleasant taste because it is clean and sweet; has not been allowed to become contaminated with dirt, nor kept at a temperature that will allow the growth of lactic acid bacteria. Fresh milk always tastes sweet, but the sweet taste disappears, owing to the growth of bacteria that both use up the milk sugar and substitute other and less pleasant tasting compounds.

The disposal of the excess of milk in the city trade depends on its quality and condition. If it is sour it is returned to the producer, who stands the loss. This is especially the case when the city dealer is handling milk on a small scale and has no conveniences for handling his surplus. In Boston the surplus is separated and the cream made into butter, and this is also the case in cities where the wholesale dealer handles sufficient milk to make it profitable. As a rule, the milk peddler does not obtain his milk directly from the farmer but from the wholesale dealer.

In many cases the milk is shipped on order each day from a creamery or receiving station and thus an attempt is made to not over supply the market; but in the milk business, as in most other things, there is a tendency for every one to look out for himself and shift the loss, if possible, onto the other fellow, who, in most cases, is the producer. It will be always possible to do this shifting, partially, if not wholly, so long as the majority of milk is produced in summer and the producers are a thinly scattered body.

If by good, is meant the quality of the milk, in regard to fat content, swale hay will produce a good quality of milk, but of course much less in amount. Milk cannot be produced without feed and a cow cannot eat sufficient swale hay to return any but a small flow of milk, but there is no reason to suppose that the quality will not be good unless the amount fed is so small as to bring the cow down to the starvation point.

Ensilage will not taint the milk if the barn and surroundings are kept clean and free from decaying material and provided the ensilage is of good quality, not mouldy or decayed. The finest quality of milk can, and is being produced on ensilage, but clean stables and cows are part of the process. Many times tainted milk comes from allowing the milk to stand in unclean stables, where it rapidly takes up any odor that may be present. Feed good ensilage after milking and there will be no trouble from odor.

A cubic foot of ice weighs 60 lbs.; you will need for cooling and packing 100 pounds per day. From this you can calculate the size of the ice house needed.

As a food, from a medical point of view, a milk containing a large per cent of fat is too rich and liable to cause stomach trouble. Probably under 4% fat is the best for feeding purposes.

Building a Cement Silo.

ED. HOARD'S DAIRYMAN:—As you request, we will try to give you the plan in detail for erecting cement silos. There may be better plans, but we got up one 16 x 30, that we are proud of.

We employed a bricklayer to oversee the work, but he was inexperienced in concrete work and not one of us who worked at it, had concreted any or seen a silo.

We leveled off the ground and marked our circle with a piece of board, with a spike in the end, then excavated about 5½ feet, till we struck hard pan. We then set our form or crib for the inside, which was made in two sections of 6 in. boards, cut 3 ft. and nailed to 2 circles marked and cut out of 1 inch pine boards, and set the form in the excavation, using the bank, of course, for the outside form, which sloped from 21 inches at bottom, to 18 inches at the top of the ground. Then we brought our outside form into use, which was made in 6 sections, out of 4 inch strips, cut 3 ft. long. We would fill the forms (3 ft. all around) and let them remain till next morning, and then raise and fill again. We built a square frame on inside to scaffold on, and a strong scaffold on the outside. We hoisted with one horse all material dry, and mixed it on the scaffold and threw it in with shovels, as mixed. The outside of the wall tapered to 8 inches at top, which required cutting out of the form each time it was raised.

We used Portland cement, clean sand and screened gravel. Before the wall tapered till it was too thin, we used several loads of flat rocks laying them carefully in the concrete.

Four openings are sufficient in a 30 ft. silo begun 5 ft. below top of ground. We made a frame out of 2 inch plank as wide as the wall is thick for jambs, less 2 in. the thickness of the 2x4 in. facing, which is nailed to jambs on inside. The 2x4 makes a groove or indenture around the opening in which to set doors out of the way of silage settling. Set this frame in the forms where an opening is wanted. We sealed up the openings with brick and lime mortar back of the wooden doors. We think openings 20x30 in. in clear are plenty large.

We did all our work with farm hands except the brick layer and he was just about as green on this job as the balance of us. We, however, got up a silo that we are proud of. It cost some more than a wooden one, but it looks as though it might be in use long after we have all joined the great majority.

If we have omitted anything that would be of benefit to any reader of the DAIRYMAN in building, and they will write us, we will take pleasure in answering and give any information we can.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., (a city of 7,000 inhabitants), and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 ft. square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm in under a high state of cultivation, and is well drained by a slight ravine running through the farm, merely sufficient for self drainage. The soil is a rich deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50,

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

Buff Jersey's Notes in the Northwest.

ED. HOARD'S DAIRYMAN:—Last week I took an outing of a few days. My line of travel took me through Iowa, Minnesota and Wisconsin. My object was to study the crop conditions through these states so as to be better prepared for institute work this fall and winter. I find, to keep well posted, institute workers must not only keep well up in their own lines of work, but must also know and see what others are doing. My specialty being corn, I had a good opportunity of studying the plant in the several states under various methods of culture and climatic conditions. Thirty years ago I helped to raise a crop of corn in St. Croix county, Wisconsin. At that time the crop was not called such so far north. It was called a patch, and patch methods of cultivation were used. Today they have fields there and up-to-date methods are in vogue, not only in the culture but in the harvesting as well. The plant has been bred and acclimated so that the present crop compares favorably with the crops we raise in this, the corn belt.

Last spring I was told at the Dairymen's Convention at Fond du Lac that the farmers in the northern counties of Wisconsin raised from 10 to 15 tons of ensilage to the acre. I was a little inclined to doubt the statement at that time. I reasoned that that yield was about as much as we got in this latitude, and could not see how such yields could be produced so far north. But it is a fact, no doubt. I saw corn all over St. Croix and Pierce counties, that will make as much ensilage per acre as we will have this year. But I am sorry to say it will not be put in silos at all, for I could learn of but one silo in Pierce county, and that out of use, and St. Croix county was but little better.

The lack of stock it seems to me is the weak spot in this section of country. A friend of mine in St. Croix county, who has 160 acres of good land, has two pigs and five or six cattle. It is not for want of feed, for oats, barley, and all kinds of hay crops do well there. The clovers are extra fine. Thirty years ago we were told that clover could not be raised there; too cold for it. Today the second crop is better than we raised in our first crop in this section.

I found through Iowa great variations in crop conditions. The corn crop was from six inches high in some fields, to tasseling and shooting ears in others, while large tracts of land were vacant, owing to excessive wet weather at time of the planting season.

Minnesota conditions were similar. I could see the lack of sufficient help all through Iowa, Minnesota and Wisconsin. In Iowa and Southern Minnesota I saw the harvest fields with only the binders at work in them; no men could be hired to shock the grain, and in talking with the farmers I was told that the amount of wages paid did not relieve the situation; the men were not in the country.

I saw 21 concrete silos at one place; they were 18 feet in diameter and 80 feet high, and what do you think, Brother Hoard, the chumps who own them don't know what they are good for. They were using them to store wheat, barley and oats in. I read their sign and it said they were the Minneapolis Concrete Elevator Co. Well, I suppose from their point of view I would be the chump if I filled the structures with the product I think them best adapted to.

In visiting River Falls, Wis, where in 1871-2 I attended school, I tried to locate some of my old schoolmates, and out of an attendance of 110 at that time, I found only two left in the town.

This trip rounds out my study of crop conditions and local requirements from Texas to St. Paul in the past few years, and the knowledge I have gained will be of value to me in presenting my subjects in the institute room, or to the readers of the various journals I may write for.

Monmouth, Ill. BUFF JERSEY.

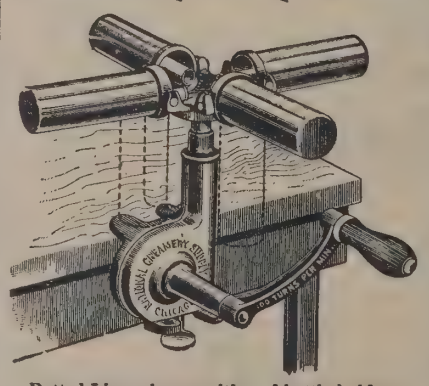
Eye Disease of Cattle.

ED. HOARD'S DAIRYMAN:—So-called "pink-eye" properly termed "contagious ophthalmia" has appeared among cattle in this and other states and presents the following effects:

SYMPTOMS.

Adult, young cattle and calves first show swelling of the eyelids accompanied by weeping. Redness of membranes of eyelids and "haw" becomes apparent; creamy discharge follows and in three or four days a clouded spot shows in center of eye and gradually spreads until "sight" of eye becomes milk colored. Changing from milk color to pearl tint, eye may become yellow, bulge, show blood-shot streaks, form an abscess and burst leaving a ragged ulcer, or commence to clear up and finally recover. Slight ulcers may heal by granulation, but extensive ruptures and ulcers often lead to loss of sight. Fever and some loss of appetite is present, especially in young cattle, for a week or more from time of first attack and dairy cows may shrink in milk production.

TREATMENT.



The disease being "catching" and doubtless due to a germ which leads to its spread from one animal to another, affected cattle should be separated from unaffected; eyes of latter should be washed once or twice a week with a solution of two drachms of boracic acid in a pint of water as a possible preventive, and pastures bordering on rivers, ponds and sloughs should be abandoned, as the disease seems most liable to attack cattle grazing on such low, wet ground. Place affected cattle in a darkened shed or stable. Give each adult animal a one pound dose of Epsom salts with one ounce of saltpeter and one ounce of ground ginger root in two quarts of warm water, as one dose, and follow with a tablespoonful of saltpeter twice daily in drinking water, or soft food. Young cattle should have the same medicine in smaller doses, according to age and size. While under treatment do not

DO YOU INTEND to buy a farm this Fall? If so, write and tell us what you want, giving size, purpose, and price you wish to pay. We have dairy and stock farms; also fine grazing lands, and fine farms for general farming. We can suit you.

Mary Anne of St. Lambert (867 lbs. 1 yr.), also Brown Bessie; fat tests showed 364 lbs. 1st. season, within year, and 15 lbs. 1 oz. (258 lbs. milk) in 1 wk ; died of milk fever this (3d) calf. Thrifty, solid color.
E. E. STEVENS, North Madison, Ohio.

feed grain, but give soft and green food; allow all the cold water animals will take.

At the commencement of an attack, puff between eyelids, by means of a clean insect powder bellows a mixture of equal parts of finely powdered calomel and boracic acid; or cover eyes with soft cloth to be kept wet with a 1-2,000 solution of bichloride of mercury (corrosive sublimate). This treatment may prove sufficient in a majority of cases, but should the disease persist and aggravate, substitute for above lotion, one consisting of a drachm each of sulphate of zinc and fluid extract of belladonna leaves, with 20 drops of carbolic acid in a quart of clean, soft water, with which to keep cloth over eyes continually wet. When inflammation subsides, should eye remain milky-appearing, paint once daily with 1-1,000 solution of bichloride of mercury or 3% solution of boracic acid. In bad cases which are tardy in responding to treatment give—except to pregnant cows—one drachm of iodide of potash, twice daily, for adult animal, and from ten to twenty grains for calves and yearlings, continuing its use for one week. Ragged ulcers may with benefit be painted with a solution of three grains of nitrate of silver in an ounce of distilled water two or three times a week. Lastly, quarantine animals bought at stockyards, shipped in, or from infected herds.

A. S. ALEXANDER,
Veterinarian.
Wis. Ag'l Exp. Sta., Madison, Wis.

The City Man and the Farmer.

ED. HOARD'S DAIRYMAN:—A few weeks ago, we saw what we considered at the time a very unjust criticism of the farmer in an editorial in the daily *Milwaukee Sentinel*. The editor in the first place showed his total ignorance of the average farmer by saying that farmers were reaping the rewards of the present prosperity without being willing to pay the advanced price in wages, and they demand long hours of labor.

As to the one thing, reaping the rewards of the present prosperity, if the editor will go over the records he will see that wheat is not one cent higher than it was 10 or 15 years ago, that the price the farmer gets for his meat, with the single exception of pork, is no higher. There is only one thing there, a demand for all he can produce that makes his income one iota larger, but he must pay the advance in machinery, help and his own living expenses, which make great inroads in that increased income the editor speaks of.

As to working out of reason, if the editor was living on a farm he would have known that hay was not hay that had been left to repeated rains and showers; that wet and soaked grain did not bring the top market; that his crops were not like a merchant; that the sun made a day's work that must be accomplished. We felt when we read it that we had not the material to answer the article, but we have now, and we think we can show to the reading world that the working man is surely digging his own pitfall.

This last week we had the privilege and great pleasure of visiting that genial host, Mr. Hope, the manager of the Mr. McK. Twombly's herd of Guernseys. What splendid cows! Many of them being tested for the advanced registry, giving from 40 to 50 pounds of milk a day, generously responding to the excellent care given them. Here is Mr. Hope, with beautiful homes for any one; with all the money needed to make farm life a success; with nature's beauty all around; with cattle in barns, cleaner than the homes that many a man and woman live in; living within an hour's ride of New York, Brooklyn, Jersey City, Newark, where men and women beg on the street, and live in sweat shops, and packed in rooms that Mr. Hope would not put a hog in; paying the best of wages; giving them the best food; working them only as they work anywhere, and his constant cry is: "What shall I do to get the necessary help to run the place, either indoors or out."

If I were a young woman and had my bread to earn, I would not be afraid to go into Mrs. Hope's kitchen or any other such place and do the cooking and feel that I would be just as well treated, just as kindly used if I did my work well, as though I was in someone's office or behind a counter, and I know I should be no less a lady in one place than the other.

If I were a young man and had to dig my living behind counters or had to peg it out of law books as a second-rate lawyer or doctor, I would far rather make my living tending a nicely-cared-for animal, taking pride in the work I could do, making a way for myself on someone's fine farm. The whole thing, that farmers abuse their help, do not give them liberty enough, is the worst kind of nonsense and when it comes from men who edit such papers as the daily *Sentinel*, it only shows their ignorance of the labor question and returns received by our farmers. The farmer is paying his just portion of the labor in more ways than one, and all he asks is just returns for the money invested, the same as any other business man

Managing the Dairy Cow.

ED. HOARD'S DAIRYMAN:—Time and again we are being called upon to pay more attention to the health, food and selection of this animal, but it is very seldom that we hear anything in reference to an equally important department of dairy knowledge—that is the management of the cow itself This branch should be most interesting to all dairymen, for, as he manages her so will the results be. In our country the dairyman has very little to guide him in arranging for better results. He has no dairy experts advising him, no practical school to attend, no one to show him where he may easily avoid undue loss. The consequence is, that the great majority of them are quite content to plod along the best way they can.

It is a noticeable fact that if more care was exercised and more interest paid to the work in the dairy, a great deal more could be accomplished by the average dairyman than is usually the case. Considering the stronghold this industry has obtained in this country, it is astonishing to find how very few dairy farmers have any idea of the individual value of their cows, and how unconcerned they are in regard to the treatment of their cows. Any person who has had experience with cows will admit, I think, that each animal has an individuality of its own, and that they differ in temper and manner, quite as much as some of their owners.

There are some that will also admit that the method in which she is bailed and handled has a marked affect upon her milk yield, but the number that carry on their milking operations in accordance with this rule is very small indeed. A general rule that exists with the majority of dairymen, is to yard their cows up as quickly as it is possible and proceed with the milking in the same boisterous fashion, the one and only object being to get the unfortunate animals through their hands as quickly as they can.

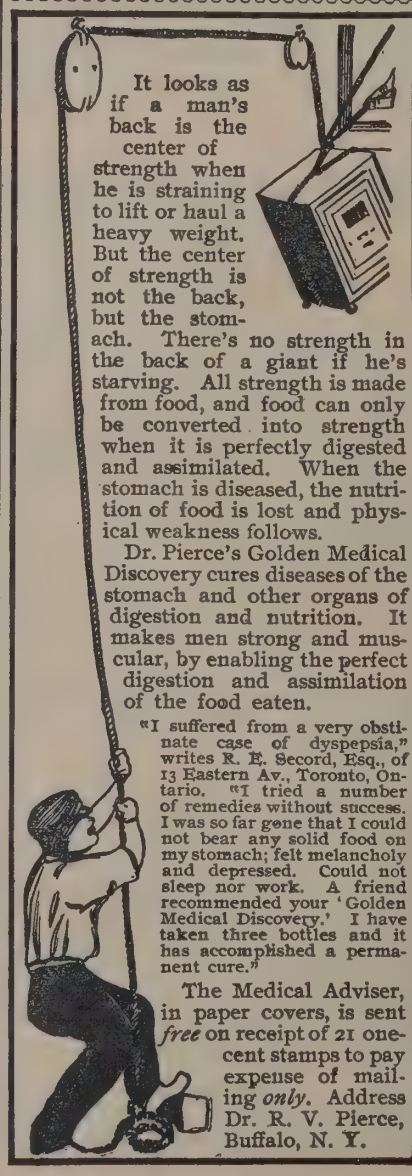
The cows are bustled into the bails and very frequently helped along with the leg rope, then their legs are pulled as far back as they will go and the milk dragged away in a brutal manner. After this process is concluded, the bail door is opened and a sharp cut across the back dismisses the unfortunate cow till the next milking.

Taking into consideration that the one object of every dairyman is to secure the largest possible yield from his cows, he should strive to find out the best means obtainable to secure this. In the first place, it is a very unwise plan to allow cows to stand too long in the milking yards. Taking an average time of two hours both morning and evening, means four hours every day waste of feeding time, besides causing unnecessary discomfort to a great many of the animals; this trouble would not become so serious a matter, but for the fact common to most herds, that the same cows are invariably left till last. If the herd would only mix and take their chance, the average time that a cow was detained in the milking yard would be greatly reduced.

It is always a noticeable fact in milking that some animals will simply rush the bails, while others appear quite the opposite, and hang back to the very last. This difficulty can be greatly overcome by having two or three receiving yards, and alternately working them into the milking yard. The proper management of a dairy herd requires one to be always on the alert, and take advantage of every opportunity that prevails and will likely to prove beneficial and economical in the management.

CLASSING THE COWS.

I have an instance before me of a trial or test, I should say, that one progressive farmer put his dairy herd to, to find out exactly which of his cows was the best, or which of them was actually returning a profit or just returning her cost and food. Each animal's milk was weighed after every milking, and the amount of food she ate was charged against her at market rates.



The result obtained from this undertaking was that about one-third of the milking herd proved profitable, one-third just cleared expenses, while the remaining third were being milked at a loss. This being a true state of affairs on one dairy, the question may be asked, what is the state of affairs on a great many of our dairies, where the milk yield is largest, during the hotter months, and during the winter months, the cows are just kept alive with artificial food? Every dairyman knows, or at least should know that he has animals that yield twice or perhaps even three times the amount of others, and eat no more food; and why are such animals kept, knowing perfectly well that they are being handled at a loss? These should be immediately weeded out and put on good pastures where they can be fattened for the butcher.

It is far better to keep twenty cows that yield a profit, than to keep thirty, twenty of which are yielding profit, while the other ten are being milked at a loss. A great deal is always being said in reference to the farmer raising the proper sort of cows, but the important question of raising calves is oftentimes entirely neglected. Frequently dairymen pay little attention to the dam of the calf he intends keeping, so long as it is a heifer one. Cows that have defects, are just as likely to transmit the evil to her offspring as the diseased animal.

This is one of the principal causes in producing defects that are continually coming before our notice in so many dairies. The selection of the animals, which you intend breeding from, for the purpose of increasing your herd, should be made with great care. The animal that is possessed of any defect, should not be retained to breed from, as far as it concerns the future herd, The very best that can be obtained by careful judgment, are in no way too good. Another matter that is well worth our earnest consideration, is the class of sire used. He should have descended from a breed that is noted, as the influence of the sire means a great deal in reference to building up a herd.

Great improvements cannot be made in the dairy without the most perfect specimens of sire and dam are selected. A good cow is very often more severely taxed than should be the case. She is looked upon to fill the milk cans satisfactorily, notwithstanding the fact that she is imposed on in many ways, such as short rations, and at some periods of the year being half frozen, while at other periods being almost burned by the hot sun, and to cap all, being raced into the milking yards by a pack of mongrels.

It is astonishing in this country to notice the quantity of dogs required on almost every dairy farm. Nearly every dairyman must have at least three or four dogs, and frequently I have noticed dairymen standing near the yards and

It looks as if a man's back is the center of strength when he is straining to lift or haul a heavy weight. But the center of strength is not the back, but the stomach. There's no strength in the back of a giant if he's starving. All strength is made from food, and food can only be converted into strength when it is perfectly digested and assimilated. When the stomach is diseased, the nutrition of food is lost and physical weakness follows.

Dr. Pierce's Golden Medical Discovery cures diseases of the stomach and other organs of digestion and nutrition. It makes men strong and muscular, by enabling the perfect digestion and assimilation of the food eaten.

"I suffered from a very obstinate case of dyspepsia," writes R. E. Secord, Esq., of 13 Eastern Av., Toronto, Ontario. "I tried a number of remedies without success. I was so far gone that I could not bear any solid food on my stomach; felt melancholy and depressed. Could not sleep nor work. A friend recommended your 'Golden Medical Discovery.' I have taken three bottles and it has accomplished a permanent cure."

The Medical Adviser, in paper covers, is sent *free* on receipt of 21 one-cent stamps to pay expense of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

The New 1903 REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

15 LaFayette Street, Utica, N. Y.

intrusting the operation of mustering to his dogs, which usually bring them along at a hard gallop. But, as I have previously stated, some people strive to get through the milking operations, heedless of the treatment they are subjecting their cows to. This sort of thing does not pay, for cows are not composed of cast-iron, and the better care that is exercised in regards to the management of the cow, the better will the returns be.

JUDGING CALVES.

Many owners of dairy herds would give more attention to grading up their stock if they were capable of judging in a reasonable degree of accuracy whether a heifer calf would eventually develop into a good milch cow. The only really reliable way to obtain a first class dairy herd, is to breed it, unless, of course a man can command a very large amount of capital, in which case he is in a position to buy only tested cows. In breeding, disappointments often occur, and the progeny of a first class sire and dam often proves a failure as a milker, but in the majority of cases if only thoroughly reliable cows, that are known to have descended from renowned stock, are used and crossed with a sire whose reputation is also good, the results must, in a great many cases, prove satisfactory.

Any person who is closely connected with stock knows perfectly well that breeding often turns out very unsatisfactory. But if a man gives in because the results turn out disappointing at times—well, he is not a true stock man, and can never expect to have a reputation as a stockbreeder. In choosing calves, to my idea, there is no outward signs that are perfectly reliable to be able to convince us that a calf will turn out a good milker. The best and only plan is to select the offspring from those cows that have a reputation as milk producers, and in a great many cases, at any rate, the results will prove satisfactory. Whatever the cross may be that is chosen for the dairy, it must be borne in mind that the use of a pure bred sire is absolutely necessary to obtain the most satisfactory results.

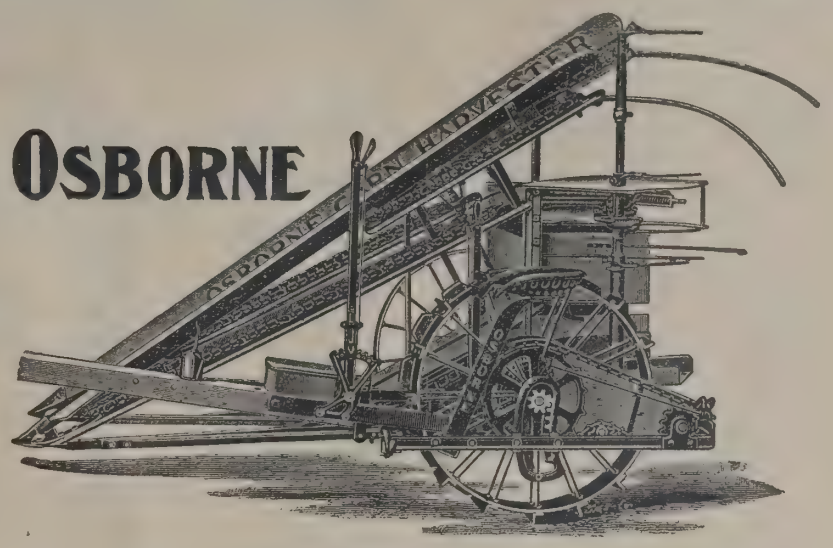
To my mind, one of the weakest points in the management of a dairy is the use of inferior sires. Then again, a great many dairymen breed from their heifers far too young. A two-year-old heifer is quite young enough to put to the bull. However, it is not possible to lay down a hard and fast rule in regard to this matter. When a heifer is brought into milk at two years old it is advisable that she remain in milk for as long a period as possible; as it is better to induce the milk flow for as long a period as possible, on the assumption that what the young heifer is taught she will continue to do.

RIGHT BREED.

In choosing the best cows to keep, attention should be given not only to its capacity for milk, butter, cheese or beef, or a combination of any two or more of them, but also its suitability to the condition under which it is to be placed. Thus the Ayrshire, Shorthorn, Holstein and the Jersey have each their places in dairying, apart from their capacity for producing milk butter and cheese. Jerseys are noted for their yield of butter fat in proportion to milk. The Ayrshire is particularly adapted for the production of cheese, their milk containing a high percentage of casein. Shorthorns of a milking type are very hard to beat, both for yield and test, and they are particularly adapted for crossing with other breeds, infusing a great deal of vigor in the cross bred. In estimating the value of cows for the dairy, the size of cattle and the quantity of milk they now produce per head are considerations, and the cost at which the milk is produced per gallon is another feature worthy of note. But there are few dairymen, although they compete in the sale of their milk, have anything more than a very faint idea of what each gallon of milk or pound of butter costs them.

AUSTRALIA.

MILKING.



ED. HOARD'S DAIRYMAN:—In reading the article, "The Art of Milking," it brought to mind an experiment I had in the amount of milk given by cows when milkers were changed. I had one man do the feeding and cleaning barns, etc. Whenever a milker was absent it fell to the lot of the feeder to milk those cows, and the feeder would almost always get from one to two lbs. more from each cow at each milking.

This set me to watching how these

D. M. Osborne & Co., St. Louis, Mo. Caledonia, Mo., June 1, 1903.

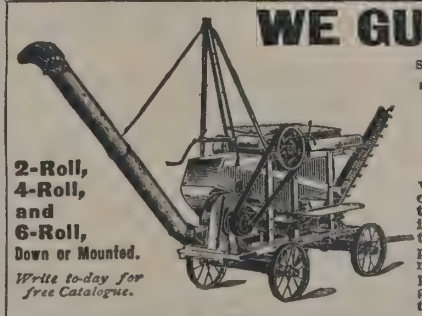
My Dear Sirs—I feel I honor my own judgment, and reflect only that which is justly due your corn harvester, when I say it is without doubt the best corn harvester on the market to-day. Last season I cut, on my own farm, 115 acres of corn, and a negro boy 16 years old managed the machine, drove the horses and did all the cutting, without one cent expense for repairs or breakage. The work could not be excelled. The corn was heavy and much of it down, and some full of weeds, but it made no difference to the machine. All corn looks alike to an Osborne Corn Harvester, and to Missourians your machine is peculiarly adapted, for it can most certainly "show them." I am, Yours very truly,
W. R. GOODYKAUNTZ,
Ex-Senator of Missouri.

OSBORNE

This Corn Book tells about Silos and Fodder. Book Free for the asking.

Scotia, N. Y., April 15, 1903.
D. M. Osborne & Co., Auburn, N. Y.
Dear Sirs—I am well pleased with the Osborne Corn Harvester I purchased of your agent, G. H. Bevis, last fall. It proved to be all it was commended. On account of the season, several places in our corn fields were deep mud, but when we cut there the machine worked just as good. The broad-faced steel drive-wheel is a great advantage on ground where it is soft. We used only two horses, and did the work easier than some of our neighbors did with three horses on another make of machine. It is certainly a very light runner. It is also a fine binder, never once having broken the twine, or missing to tie, thus using less twine than others, besides delay and trouble. I would say, in a word, that the machine is practically perfect. Very truly yours, CHARLES P. SANDERS.

THE OLD WAY A COLONIAL HUSKING BEE



When She Found a Red Ear
at the old-time husking bee, a penalty was exacted.
It was great sport for the boys and girls.

DEERING HUSKERS AND SHREDDERS

have stopped the sport but have saved mints of money for the modern farmer. **DEERING** two-roll and four-roll shredders fill every requirement of the large or small farmer, double his profit, and ease his labor. THEY ARE MODERN, UP-TO-DATE MACHINES
Write or ask your nearest dealer for a "Deering Corn Annual" and post upon the **IDEAL LINE** of corn binders, corn shockers, huskers and shredders.

THE NEW WAY DEERING HUSKER and SHREDDER

WE GUARANTEE that under the same conditions as to power and speed applied, condition of corn, etc.,
The Appleton Corn Husker
will do more and better work than any other machine of like character and corresponding size on the market; that it is simpler in construction; easier in every way to operate; easier and safer to feed and to require less power for successful operation. The proof of these claims is sent for the asking. We make also a complete line of sweep and tread horse powers, shellers, ensilage and fodder cutters, feed grinders, wood saws, windmills, etc. Remember that Appleton quality is the standard of excellence.
2-Roll, 4-Roll, and 6-Roll, Down or Mounted.

CHICAGO, ILL. BRANCH: MINNEAPOLIS, MINN.

cows were milked, the treatment, etc. Finding nothing wrong in the milkers' methods, I came to the conclusion that the cows were simply rewarding the feeder, knowing him to be the one who fed them and who was around them at all hours of the day, became attached to him as though he were their calf. Since then I have arranged to have each milker feed his own cows and the results warrant the change. So now, I wonder, have the other experimenters had my experience and the feeder been rewarded by the cows and praised by his employer for being the better milker. UNCLE ABE.

Brownsville, Tex.

CONCERNING OUR ADVERTISERS.

REPORT OF A LIPPING TEST.

Made with Chloro-Naptholeum Dip at Atwood, Colorado, June 11, 1903. Dip used cold; ratio, 1 gal. dip to 33 gals water. Report rendered by C. B Goddard, Sterling, Colorado, one month after the dipping. A. B. Holl dipped nine head of cattle. Cured. E. Rowe, dipped one cow. Cured. Henry Witmer, dipped 8 head cattle. Thinks them cured.

The two reports following were received in June from the breeders whose names appear.

"Cattle dipped May 20th at Atwood, Colo., by Dr. Norgaard, in Chloro-Naptholeum Dip, now show that they are free from lice and itch and cleaning off in nice condition." Wilder Jones.

"Three weeks after dipping 38 head of colts and horses which were very lousy and in bad condition they are entirely free from lice and in fine shape. I only dipped once in Chloro Naptholum Dip, at Atwood, Colo., May 20." G. C. Brown

Chloro-Naptholeum Dip is doing wonders wherever used. Such of our readers as desire facts of interest regarding the health and growth of their stock are invited to write for books and testimonials to the West Disinfecting Co., 8 E. 59th St., New York, and same will be sent them at once.

The Roycroft Fly Knocker advertised by the Brown Chemical Co., of Cleveland, O., is one of the best remedies to get rid of flies that there is on the market, and price reasonable. The company is responsible and readers interested should write them.

Be sure that your wife sees the Elwell Kitchen Cabinet ad on another page. This is positively one of the greatest labor savers that could be put into a kitchen. Just drop a card to Elwell Kitchen Cabinet Co., 926 5th Ave. S. E., Minneapolis, Minn., for circulars.

Which is More Profitable, Making Butter or Shipping Cream?

Please tell me through the DAIRYMAN which is generally the more profitable, making butter or shipping cream? If you have any readers who are shipping cream to Buffalo, N. Y., I would be pleased to have them tell all how they handle their cream, what prices are received, and also name some good, responsible parties to deal with. I have a herd of ten cows and want to secure a cream trade if profitable. F. H. L.

Arkport, N. Y.

Parties in Wisconsin who ship cream to Milwaukee to dealers, receive about the same price for the fat in the cream that they would receive if the cream was made into butter, and claim that the expense and labor connected with shipping is somewhat less than the expense and labor in making and marketing the butter.

Will New York readers in the vicinity of Buffalo kindly note the inquiry, as above, specially directed to them?

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Swollen Udder.

I have a cow that has a tendency to have one quarter of her udder swell occasionally. She will come up at night with one quarter caked hard and perhaps by morning it will be nearly or quite gone, but the milk will be ropy.

If a cow is giving a good flow of milk, is in good condition and on good pasture, what is the object of drying her off six or eight weeks before she is due to calve? Will she give enough more milk the next year to make up the loss? What is the most approved way of drying off a persistent milker? S. H. M.

Decatur, Mich.

ANSWER.

The cow is very likely squeezing the udder while lying on it in the pasture or stable, which accounts for the swelling. Narrow and uncomfortable stalls are sometimes the cause. Remove the cause.

It is a well established fact that a cow, to do her best, must have a rest between periods, and if it is not given before calving, she will take it in a lessened flow of milk during her next lactation period.

Obstructed Teat.

I have a cow that has a small lump about the size of a pea in one of her teats, that moves up and down when milking and when it is at the end of teat the milk will not come and I have to push it up to top of teat before milk will come again. I also have a cow that had a calf 16 months ago and was bred two months ago, that at times has a swollen place on one quarter of her udder and the milk at that time is too yellow and sometimes stringy. Sometimes the udder is all right for a few weeks and then the rising comes again, and comes and goes at intervals. J. B. L.

McDonough, Ga.

ANSWER.

1. See obstructed teat this issue.

2. The swelling of this quarter is probably due to some bruise, which reoccurs whenever the cow lays on th-

Pigs At Weaning Time

Stand a chance of slow development for a time. Grain or sour milk is harder to digest than the milk of the dam. The digestive organs require special aid at this time. As the feeding period of the hog is short—and the shorter the better—it is expedient to strengthen and build strong every digestive organ while the pig is young.

Dr. Hess Stock Food, the great hog tonic, makes pigs grow fast, healthy and strong: expels worms, aids digestion and assimilation and causes all of the nutrition to be applied to bone and muscle building. Stewart, the great American authority on feeding, says:—"The mother is supposed to impart to the young her own digestive system." It is, therefore, important that even sows should be fed this scientific compound that they may impart perfect digestion to the offspring. A penny's worth feeds 8 hogs. Feed Dr. Hess Stock Food regularly as directed disinfect the pens and feeding places with Instant Louse Killer, and we guarantee that your hogs will be free from disease. E. C. BURLINGAME Co., Walla Walla, Wash., write: "Enclosed find check for $25.00. Please send us 500 lbs. of Dr. Hess Stock Food. We want something to start our young pigs when they are being weaned. We used 300 lbs. lately and liked it very much."

Dr. Hess Stock Book FREE

A complete treatise on stock and poultry diseases, written by Dr. Hess (M. D., D. V. S.) and sent free, postage paid, if you will write Dr. Hess & Clark, Ashland, Ohio, and say what stock you have—how many head of each kind; what stock food you have fed, and mention this paper.

Prof. W. S. Goss, Dean of Talladega, Ala., College, says of it:—"I think Dr. Hess' Book a little gem. I shall keep it near me for reference."

DR. HESS Stock Food

is the only scientific compound for hogs, cattle, horses and sheep. It is formulated by Dr. Hess (M. D., D.V.S.) If the medical and veterinary colleges know of nothing better it must be good. No unprofessional manufacturer can equal it.

Dr. Hess Stock Food is sold on a written guarantee, 100 lbs. for $5.00 (except in Canada and Pacific Slope) smaller quantities at slight advance. Fed in a small dose.

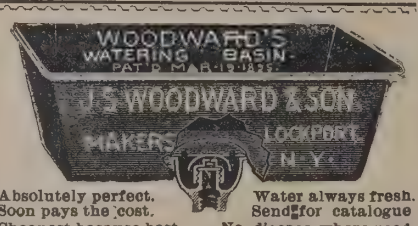
Our Information Bureau.—For any disease or condition for which Dr. Hess Stock Food is not recommended, a little yellow card enclosed in every package entitles you to a letter of advice and a special prescription from Dr. Hess (M. D., D. V. S.). In this manner you are provided with a universal treatment for all stock diseases, either in the Stock Food itself or in the special prescription to which the little yellow card entitles you.

Dr. HESS & CLARK, Ashland, Ohio.

Also manufacturers of Dr. Hess Poultry Pan-a-ce-a and Dr. Hess Healing Powder.

Instant Louse Killer Kills Lice.

Water In The Stable a Necessity.



It is universally acknowledged that stock in the stable should have constant access to water of suitable temperature, and all progressive Dairymen are putting in some form of Watering Device. **Why not use the Best?** Write for descriptive circular.

quarter, which accounts for the highly colored milk, as it most likely contains some blood. Remove the cause and nature will do the rest.

Catarrh.

Young calves start with a running nose, and then ends, into a hacking cough which comes from their lungs. SINTON DAIRY CO.
Colorado Springs, Colo.

ANSWER.

Your calves are troubled with catarrh of the anterior air chambers, which involves the throat. Make a liniment of equal parts of turpentine and raw linseed oil and rub over the face and throat, once daily. Apply it warm. Give the following twice daily: Camphor, one-half oz.; fluid extract belladonna, 2 drs.; fluid extract glycyrrhiza pulverized, 1 oz.; hydrastis pulverized, 1 oz.; gentian root, 1 oz. Add honey enough to make a paste and give a teaspoonful on the tongue at each dose.

Goitre.—Inflamed Gland.

Will you give me a remedy for bunches on calf's throat size of a small hen's egg.
Cow has swelling at the end of jaw. It extends up within two or three inches of the ear. It is not hard It sometimes affects her breathing. She eats well. Is the milk fit for use? O. T. R.
Eau Claire, Wis.

ANSWER.

The calves have enlarged thyroid glands known as goitre. These are not dangerous and will disappear of their own accord, especially if they are as small as you mention. Painting them with tr. iodine will hasten their disappearance.

The enlargement appears to be an inflamed parotid gland, which does not affect the milk. Apply the following ointment:

Ung. hydrargyrum fort., 4 oz.; powdered curcurimus, 3 oz.; oil of gaultheria, 2 dr. Rub well once daily.

Obstructed Teat.

I have a young Jersey heifer; first calf. One teat is obstructed. Only a tablespoonful of milk can be drawn. O. D. B.
La Porte, Ind.

ANSWER.

Your remedy is the teat bistoury. Cut the obstructed portion (after inserting your instrument through it), in four opposite directions; then milk frequently. The flow will keep the teat open.

Excessive Salivation.

A young Jersey cow in good condition, milking well and in good health, chews cud, seems to be excessively slimy in the mouth. The slime runs steadily from her mouth in a stream. It has been like this for two months. It smells like her breath would when she is just throwing up the cud; but if it lies on the stable floor becomes very sour.
Salt Spring Island, B. C. C. E. A.

ANSWER.

Excessive salivation is almost invariably a sign of irregular or faulty teeth. Have the teeth examined, and you will discover the cause, which if removed, will remedy the trouble,

A Buller.

I have a Jersey cow that was fresh about 15 months ago, and was said to have been served soon after, but did not catch. For past few months have had her in pasture with a very fine bull. This cow is constantly mounting other cows when they are in heat, and tries to fight bull off, but never gets in heat herself. J. W. G.
Leland, N. C

ANSWER.

Cows in this condition are commonly known as bullers. They will constantly ride other cows when in heat, but when they come in heat themselves, will not allow the bull to mount them. Take close notice when she comes in heat, then suddenly take her to a strange bull, with whom she is not familiar, and she can often be induced to allow the service. Sometimes it may be necessary to force her. It is always best not to keep her fat.

Ring Worm.

I have got a lot of calves that have had the ringworm. They have got a dry cough and they eat well and the more they eat the weaker they get and then they die. I also have a cow that sucks herself. J. McC.
Enumclaw, Wash.

ANSWER.

No. 1. Apply Chloro-Naptholeum or Zenoleum as directed on package for this purpose.

No. 2. Apply a calf weaner to the nose and she will not care to suck her self.

Warts.

I have a 3-year-old heifer which has warts on inside of both fore legs between knee and body. One got as large as a teacup about the shape of a round turnip. I corded this and took it off, but soon other little ones started near by and are growing. C. H. D.
Pharsalia, N. M.

ANSWER.

The safest way to remove them is with a knife. Take them out completely and cover the parts with carbonate of soda.

Skin Trouble.

I have a cow 10 years old; has always appeared well and hearty. Last winter the hair came off from her in spots from the size of a dime to a dollar all over body and neck. Very little hair has grown in this summer, and she is as spotted as last winter. She will freshen in four weeks. Would you consider milk suitable for family use?

One of my yearling heifers died recently. All cattle feed on range here and can help themselves to all kinds of feed—some poison ivy and poison oak. One morning I noticed heifer seemed fuller than usual and a little inactive, but she ate and went on range that day, next morning still fuller and breathing hard, would not lie down. I drenched twice during day with salts and oil, but could get no passage of account. What passed was black and thin. She was swelled full at night and suffering. I tapped paunch, but it relieved her very little. Post mortem revealed little—small stomach and bowels natural, paunch all right excepting it contained too much fluid of some kind. G. A. C.
Citronelle, Ala.

ANSWER.

1. It is quite likely that the hair will come again when she sheds in the fall. It does not affect the milk.

2. Might have been obstruction. The above description answers quite well to an obstruction in the digestive tract, perhaps intersusception, which may have escaped your notice when opening, or possibly a gut-tye, for which there is no known remedy which has proven successful in the cow.

Acute Indigestion.

My heifer that calved in June, was taken suddenly and appeared to have brain trouble, jumped trembled and ran in fence, then would act as though feeding, but no feed where she was. Seemed to be trying to lick her left side and turned round constantly, but acted as though her tongue was paralyzed. Kept stepping with front feet and lifted left hind foot against belly. Gave her remedy for indigestion and she recovered, but would like to know if that was her trouble.
Corydon, Pa. L. R. S.

ANSWER.

Your heifer had acute indigestion, which very often brings about the symptoms above mentioned. Your treatment was in the right direction.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from **Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING.** *Impossible to produce scar or blemish.* Every bottle sold is warranted to give satisfaction Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars.

MOORE BROS., V. S., Albany, N. Y.

Our New Patent

and Great sales are the talk of all who know of them. A fortune has been made by the patentee and the farmer in a short time. For seven months the sales were over $350 00 per day. Something good can't be gotten for nothing. By putting $500.00 and upwards into this business it will be the best paying investment we know of. Farmers using the machine say that they would not do without it for two, three, and ten times the price. Common farmer can handle it in a very paying way. We can prove the great selling qualities of this machine by bank account, the bankers themselves, and the farmer. Our plan is fair and honest. Best bank references. Car fare one way will be paid to responsible men whether they invest or not.

To Keep Milk Sweet.

Didn't Know the Law was Loaded.

We read very often of accidents, some fatal and others serious, from the careless handling of fire-arms, and the excuse most frequently given is, "I didn't know it was loaded." Something similar to this happened to a Pennsylvania subscriber, who writes us as follows:

"I am sorry to tell you the bad news that a whole lot of us got pinched to the amount of $63 and some cents, for adding a little preservative to the milk. What would you advise me to do to keep my milk sweet for twenty-four hours, without going to the expense of buying a machine? I cannot afford to buy a machine. It surely hit me hard.

"Would you advise me to stop feeding malt (brewers' wet grains), on account of being against the laws of our state?"

Laws, whether good or bad, should be observed. That which they forbid should be avoided; that which they command, should be complied with. Laws against the use of preservatives in milk are good laws, necessary laws, laws for the protection of the health and lives of people who use milk, and especially of children and infants. Laws forbidding the feeding of brewers grains do not commend themselves to our judgment, but where they exist they should be obeyed until they are repealed or modified.

To keep milk sweet for twenty-four hours without the use of any machine or preservative is comparatively a simple proposition. In the first place, all the milk vessels must be thoroughly cleaned, and cleanliness means something more than the absence of visible dirt. Pails and cans must not only be washed, using washing soda instead of soap, but after the most thorough washing possible, they should be thoroughly scalded, not simply with warm water, but with water that is boiling hot. And when it comes to milking, the udders and flanks of the cows should be thoroughly brushed and then dampened. The brushing and the dampening should be so thorough and complete, that nothing in the shape of dirt, or hair, or black specks of any kind should show on the surface of the milk. After drawing the milk in this way and into pails thus cleaned and scalded, remove it at once from the barn and all other contaminating surroundings and cool it. Get some narrow, deep pails to hold the milk, set them in cold water, and as the milk is cooling, stir it every few minutes. Milk thus drawn from the cow and kept at 50 degrees temperature will keep sweet for twenty-four hours or longer.

We have answered the concluding question about feed. If the law says "Do not feed wet grains," simply obey the law and feed something else.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

GOOD INTENTIONS ALONE CANNOT PRODUCE GOOD MACHINERY. Most all manufacturers are honest, but lack the experience and equipment necessary to turn out a thoroughly first class engine. Northern Vermont Farming.

Results of Attention to Business and Determination to Succeed.

ED. HOARD'S DAIRYMAN:—We have some good farmers here in the northern part of the state, and as we belong to Franklin county, that is largely devoted to dairy interests, there is naturally a little emulation among the farmers to see who will do the best.

One of these enterprising farmers is James C. Towle of Berkshire, P. O. Enosburg Falls—a relative of the writer, but nevertheless, a man full of energy, and a praiseworthy determination to succeed in the occupation inherited from his ancestors. He has a farm large enough for all practical purposes, and which, under his management, is improving from year to year.

Notwithstanding the very dry time we had here up to June 10, the worst ever known, the crops generally are looking well and promise good returns. The yield of hay will hardly be up to the average, but the deficiency will be fully made up by the excellent crops of corn and oats, or peas and oats, of which some are raised and much liked.

On this farm there are 55 head of cattle of all ages, 32 of which are cows. The cattle are practically full blood Jersey and 11 are registered. The foundation stock came from that part of the state well known to the DAIRYMAN—Pomfret, celebrated for the excellence of its Jerseys—from the herd of Mr. F. L. Davis, Secretary of our State Dairymen's Association. The herd is headed by a bull tracing back to Hood's Farm "Mint" strain, and he by "Diploma."

There has already a good start been made in way of improvement, which it is the intention to keep up by sires of the best butter strains, and the results are already becoming apparent in the increased yield of product. The animals are of solid color, light fawn, and possess much uniformity and substance.

The butter is made on the farm and up-to-date fixtures are in use. One-half of the product is put in pound prints for the home trade and the rest in 30 lb. tubs is shipped to Boston.

Last year, 30 cows gave an average of 300 lbs., which sold for 24 cts. a pound, the season through; a very good price indeed, making the gross income per cow $72.

This was a very satisfactory record, but he is working for and expecting to do better this year, as thus far the figures are ahead of last year.

The cows commence to come fresh in milk in the fall and butter is made the year round. At time of visit the cows were averaging a little over one pound a day. For several years has had a silo, but last year, owing to the almost failure of the crop, it was not filled. With good ensilage the past winter the cows must have done still better at the pail. Has fed grain all summer, from 2 to 4 quarts of bran and gluten, and the cows have held out well in yield of milk and butter; proving that in his case there is being good returns for cost of grain.

This year the milk from each cow is being weighed and once a month a test is made whereby he expects to find whether he has any cows in his herd that are not paying expenses. It will be interesting to learn the results at the close of the year.

A new silo, 16×20 feet and 30 feet in height, is being built adjoining the barn on the outside. It is practically an eight-sided building, the corners being cut off so as to measure three feet on the inside. It will be thoroughly built, commodious and convenient for use. Twelve acres of corn are growing, from which the silo is to be filled.

A large portion of a heavy oat crop will be made into hay. A feed each of silage, grass hay and oat hay, with a proper allowance of grain, it is calculated along with good stables, plenty of water and the needed attention, will enable the cows to do their best another winter. Calves and pigs are grown on the skim milk.

An only son, a graduate of our state Agricultural College, is much interested in farming, and is expected, by and by, to take the father's place and carry on the work so auspiciously begun. It is perhaps unnecessary to add that father and son both take much interest in agricultural affairs, and that HOARD'S DAIRYMAN is a welcome and prized visitor in their home.

E. R. TOWLE.

Made for the man who wants the best.

Cover Three Times the Ground and Spread 15 Times as Fast as by Hand with the

Great Western Endless Apron Manure Spreader.

And when the job is done it is done to a purpose. The manure does not lie over the field in chunks to waste away, but whatever its character, **coarse, lumpy, strawy, caked, fresh, lime, plaster, etc.,** it is pulverized and evenly distributed, so that every particle enters the soil to nurture plant life. Compared with other spreaders it is **THE MACHINE OF MANY SPECIAL FEATURES.** Endless apron makes it always ready to load. Spreads thick or thin as desired, 3 to 25 loads per acre. Regulated while in motion. Front axle cuts under and turns on the ground it stands on. Chunks held on beater by non-bunchable rake until pulverized. Combined hood and end gate keeps manure from beater while loading and acts as hood in spreading. Broad tires, meadows and grain fields are top dressed without rutting. Light draft, strong and durable. **FULL GUARANTEE** with every machine. Write for our large catalogue. It tells how to secure best results from the manure pile and shows how the **Great Western** has mastered the matter of spreading. Mailed free.

SMITH MANURE SPREADER CO., 59 N. JEFFERSON ST., CHICAGO, ILL.

New American Manure Spreaders

hold from 50 to 100 bushels. Spread just as thin or thick, fine or coarse, as ground requires. Don't have to stop ...m to make change. Most substantial, largest capacity, high draft.

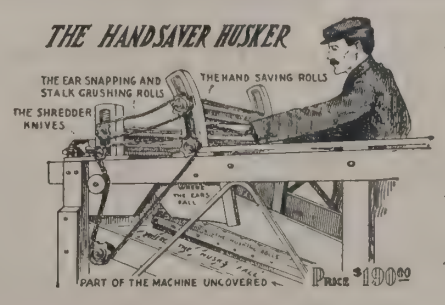
Send today for Booklet B.

American Harrow Co
Detroit, Mich.

SAVES ITS COST ON THE FIRST CROP.

It spreads all kinds of manure, lime, salt, ashes, compost, etc., either broadcast or in rows. Does it better than it can possibly be done by hand.

Do you know of any other piece of machinery for use on the farm of which this can be truly said?



The Improved Kemp Manure Spreader

not only makes easy work of getting out the manure, but by the way in which it breaks it up and makes it fine, it more than trebles the value of the same. It will break up and spread evenly, manure that cannot be handled with a fork. It doesn't matter how hard, lumpy, caked, strawy, or stalky the manure is, this machine will spread it. It makes fine, well rotted manure go a long ways in top dressing wheat in the spring, meadow lands, pasture, etc. Being mounted on broad faced wheels, it can be handled on any kind of ground without serious cutting in or rutting. Can spread back and forth, as front wheels turn entirely under. Can be turned on the ground it stands on. 1903 machine has our new **Beater-Freeing Device, Apron-Returning Device** and numerous other improvements. Send for latest catalogue (free) and read about these and other advantages and also about **"How to Grow Big Crops."** Remember that the only original and genuine Kemp Manure Spreader is made by us and the patents thereon have been fully sustained by a recent decision of the U. S. Circuit Court.

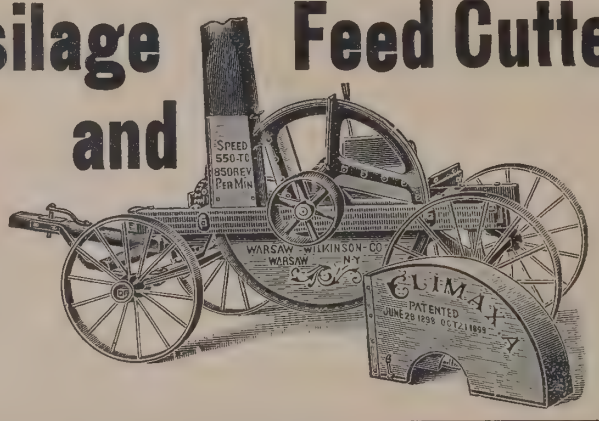
ENSILAGE CUTTER



These cutters are built especially for Silo use and are strong throughout in their construction, with heavy frame built lowto avoid extra staging or tables to feed from. The cylinder shaft is 1¾ in. steel and has 3 babbited boxes, making 13½ inches of bearing surface. The balance wheel is closed, weighing 170 pounds, secured by side headbolts on flanged collar, keyed on the shaft; the heads of these bolts turn ¼, in case of any obstruction reaching the knives, and allow the balance wheel and pulley free speed, while the strain on the knives is relieved at once. The traveling feed table is controlled by the reversible lever and is instantly stopped or reversed. The slats on these tables travel over a close bed, full length and are close together to prevent fine leaves getting into them and winding on the rollers, also guards over the chain links. The length of cut is easily adjusted from ⅝ to ⅝ and ⅞ inches by the gears on the shaft. We furnish chain elevators of any length desired, straight away or side delivery. Weight of Cutters with traveling table, 1600 pounds. Send for circulars.

I. B. ROWELL CO.,
MENOMINEE FALLS, WIS.

CLIMAX

Ensilage and Feed Cutters.

"THE COMPLETE MACHINE"

CLIMAX machines are original. They are not made over from old models, in an attempt to turn them into blowers, by adding a number of chains, belts, or other attachments. They are made to elevate by wind delivery, and every part is built with this end in view. They are sold under an absolute guarantee to do the work, and **never** fail.

CLIMAX machines passed the experimental stage eight years ago. It has never been necessary to change any essential feature of the original pattern. We are still using the straight knives, with the shearing, inward cut; the elevating is still done with the same wheel as the cutting, requiring less power; the smooth reversing gear, which is positive and cannot break; the large feeding rollers, which won't choke, and the knife adjustment, which sets every knife at once and sets them **true.** All these have stood the test and cannot be had with any other machine.

The combination of simplicity, great strength, large capacity and few wearing parts, places the **CLIMAX** in the very front rank. When you have a binding guarantee as well, there should be no doubt regarding the machine. Catalogue for the asking.

WARSAW-WILKINSON CO., WARSAW, N. Y.

WILDER'S WHIRLWIND

ENSILAGE CUTTERS

Run with Less Power than any Other Cutter.

Have adjustable Cutting Heads and adjustable Table Knives. Solid Balance Wheel with knives and fans attached.

TWO or FOUR KNIVES, or Shredder attachments as preferred. Stop and reverse levers.

Furnished with plain or self feed table.

Read a sample of the many testimonials which we received last year:

CENTRAL DAIRY FARM, Farmington, Ga., Aug. 28, 1902.

GENTLEMEN: The Whirlwind has arrived. Allow me to say you have given it the right name. I had an old 6 H. P. engine to run it with, and it was an old one, having considerable lost motion. When I placed the Whirlwind in motion I had great doubts about my little worn out engine giving power enough, but when I placed the belt on and began to run it I had great fear it would blow the top of my silo off. I never bought a machine that gave such perfect satisfaction. You do not say half as much good about it as it deserves.

Yours very respectfully, JAMES D. PRICE.

We have also a full line of Cylinder Cutters and Shredders with blowers or chain carriers.

Write for catalogue of the MOST complete line of Ensilage and Feed Cutting Machinery made.

Handling the Bull.

ED. HOARD'S DAIRYMAN:—A young man in this county was gored by a valuable Jersey bull so that he died. After that event the animal was dehorned, and we wonder why people take such risks, but such is the case. Twenty-five years have passed since the writer has been old enough to handle stock, and I am convinced that a bull is not a trusty animal at any time, not even when dehorned. They should have firm, kind treatment from the very first, no one being allowed to fool with them, or teach them any tricks when young.

Our experience in buying has been that rarely one can be led or handled with any comfort. We have kept a number of Jerseys until they were three to five years of age. All were gentle and good to lead. Some of them we gave exercise, two or three hours a day, by having a long, light chain fastened to the ring in their nose and other end to an old mowing machine wheel, which could be easily moved to fresh feed in the lot. We take a pitchfork in hand when we lead them, as a safeguard, not to use unless orders are disobeyed, then not to abuse, but that they may know what is expected.

A marked example of the results of abuse was shown by a Polled Durham, which was gentle for me to lead with a halter, yet a man who a part of the time cared for him and seemed to think such animals needed much kicking, could not manage him, and in taking the bull to the station after he was sold, abused him so that he was unfit to ship; the animal subsequently showed his dislike to the man, by bellowing every time he passed near in the stable.

Last year being a very wet season, the weeds got the start of our corn so that the feeding season found us with only fifteen feet in our silo, when we should have had twice that amount of ensilage from same ground. Not wishing to reduce the number of cows, or to buy hay, we studied how to feed, writing HOARD'S DAIRYMAN for balanced ration; also had bulletins from different stations. We weighed, measured, estimated, fed and watched results. We not only wintered thirty-one head of cattle in excellent condition (and three horses), but made, from Dec. 16, to last of April, while creamery was closed, over 500 lbs. of butter, which customers wanted faster than could get it, at 25 cents. Still have little old hay and 100 bushels of oats on hand, and have had the satisfaction of taking the most milk to creamery of any patron, where amount supplied has exceeded 7,000 lbs. daily at highest point.

Necessity has compelled us to learn how to supply protein feed on the farm. The best we have been able to raise is Canada peas with oats, which we are now feeding. Early in June we turned into a newly seeded piece of timothy and clover; after that, mowed clover and fed until peas blossomed. Oats sown at different times will last till early millet, corn and soy beans. The latter, grown from Michigan seed, at present are quite promising, though this is our first trial with them.

Thanks for the help received from HOARD'S DAIRYMAN. It pays a farmer in money and pleasure to study his business. F. I. C.

Orwell, Pa.

Breeding for Sex.

A subscriber at Red Deer, Alberta, in sending for a copy of King's Physics of Agriculture and Mrs. Jones' Dairying for Profit, adds to his letter as follows:

"Some dairymen near here, who consider that they know, have had a run of steer calves. Surrounding, ordinary mortals have about half steers and half heifers. The dairymen say their run of steers is owing to the extra care and attention their cattle get. Is there any sense in this contention?

There may be more "sense in this contention" than we have been accustomed to think, but there has been too little close observation along these lines to warrant any positive conclusions one way or the other. It is quite a general complaint among breeders of high class cattle that there is a super-abundance of males and it is possible that the lack of exercise and extra care and feed given to the sires is responsible for these results.

The Expert Cleaner.

There are a score of things about the house that you will not undertake to clean. You fear that they would be ruined by soap and you intend to send them to an expert cleaner, an idea that comes down from a time before pure soap was made. The manufacturers of Ivory Soap are constantly asked if they know how beautifully this or that material can be cleaned with Ivory Soap. The uses of Ivory Soap are too numerous to be told; with it anything may be cleaned that will stand the application of water. You can be your own expert cleaner.

Three Generations of Holsteins and Their Records.

ED. HOARD'S DAIRYMAN:—The accompanying photographs representthree of the young Holsteins at the University of Wisconsin. The cow, Alma Marie 3rd, was purchased as a two-year-old heifer for $74. As will be noticed from the cut shown, she is a small and very much refined Holstein. She has for the past four years given the following amounts of milk and butter:

In 1899 she gave 9102.6 lbs.of milk and 292.93 lbs. of butter fat, or 342 lbs. of butter, yielding a profit over cost of feed $31.34; also gave birth to the heifer, Alma Marie Josephine shown in the accompanying photograph.

In 1900 her record was 10811.4 lbs. of milk, 360.57 lbs. of fat, or 420 lbs. of butter, yielding a net profit of $50.14; also a bull calf that sold for $45.

In 1901 she gave 13732 lbs. of milk containing 432.98 lbs. of fat, or 505 lbs. of butter and a profit of $48.74; also a bull calf that sold for $50.

In 1902 she gave 10195 lbs. of milk containing 313.66 lbs. of fat, or 366 lbs. of butter, yielding a net profit of $48.10 and a fine heifer calf.

The photograph of the heifer, Alma Marie Josephine, shows her in her two-year-old form. This heifer has recently been awarded first prize in the seven-day official tests for Holstein heifers three years old, and in addition was awarded third prize in the economic production tests for heifers in this class. During the seven days of her official test she consumed 32 lbs. of hay, 760 lbs. sugar beets, 21.4 lbs. ground corn, 17.31 lbs. oil meal, 17.37 lbs. gluten meal, 42.8 lbs. of bran and 21.5 lbs. of ground oats. The total value of feed consumed during the week was $1.82. She gave 417.3 lbs. of milk, which averaged 3.77 per cent fat, or a total of 15.74 lbs. of fat, equivalent to 18.36 lbs. of butter. As a two-year-old heifer she dropped a heifer calf that is now merging into cowhood and is very promising. She made in her two-year-old form, a yearly record of 9658.4 lbs. of milk, containing 340.28 lbs. of butter fat, or 397 lbs. of butter, returning a profit over cost of feed of $46 47.

A representative of the third generation of this family is seen in the last calf of Alma Marie Josephine, shown in the photograph at six months of age, and represents one of the highest types of a strongly bred Holstein bull calf.

W. L. CARLYLE.

Experiment Station, Madison, Wis.

Treatment of Anthrax by Antiseptics.

ED. HOARD'S DAIRYMAN:—Apart from being used as a disinfectant, carbolic acid has, among many veterinarians, come into extensive use as an internal remedy for anthrax and other contageous diseases of animals, notably cattle plague, pleuro-pneumonia, and foot and mouth disease.

In dealing with outbreaks of anthrax, a difficulty is experienced in estimating the value of any system of preventive or curative treatment, for reasons which I will presently show. Meanwhile, I may remark that laboratory experiments which demonstrated the destructive action of certain agents on disease producing microbes, rendering them inert, so far as can be ascertained, by inoculation and cultivation, do not necessarily point the way to cure or prevention.

It is interesting and instructive to immerse a certain quantity of virus in antiseptic solutions of different degrees of potency, and then to inoculate the virus into an animal, or into a test tube of culture material, and observe the result; but it by no means follows that the same result will follow the use of the agents thus proved as microbe killers, for prevention of disease in an infected herd or flock. The conditions are obviously entirely different. Instead of the antiseptic being brought in direct contact with the microbe, it has to be introduced into the animal's stomach, become absorbed, and carried the round of the circulation, undergoing, probably, unexpected changes during its course, which may seriously disturb its normal action.

Anthrax is, perhaps, of all animal plagues the most difficult to deal with. Firstly, it should be implanted in the mind of the farmer, the obvious risk of the extension of the affection by the common and reckless mode of dealing with carcasses of animals found in a field, or in a shed, and it will be convenient now to consider what means should be adopted for the protection of the remaining animals which have been exposed to contact with the virus of the disease.

It cannot be doubted that removal of the herd from the part of the farm where the first case occurred is, as a rule, desirable; indeed unless the circumstances are very exceptional, necessary. Next, the use of antiseptics is certainly to be advocated, and at this point occurs the trouble about estimating results. Anthrax, it may be observed, has a very remarkable record. It may cease after one or two animals have been attacked, or it may clear the whole of the stock—horses, cattle, sheep, pigs and dogs—off a farm in a short time. I remember well such an attack as this in the west of England some ten years since, when the fatal cases reached the extraordinary number of sixty cattle, nine sheep and seven horses.

This is the more extraordinary when we consider the supposed average loss in cases of anthrax is a little over two animals in each outbreak.

Within a short time after this, another outbreak occurred not far away when only one animal was lost.

Statistics and every day experience, go to prove that extensive outbreak, of anthrax are not only exceptional, but are also almost always the result of what may be termed unintelligible neglect of common and obvious precautions.

What can be said, for instance, of cutting the throat of an animal dying, or just dead, of anthrax in an open field or cattle yard, taking the hide off, dragging it across the meadow to a convenient place to keep it until it can be disposed of, and throwing the carcass onto a manure heap, or giving it to the pigs? The whole procedure, which has come under my observation repeatedly, amounts to a vast experiment in inoculation, an experiment, I may add, which has proved in most cases remarkably successful.

The above few remarks on the disease exhibit its salient characters in their sharply defined contrasts, and explains the remark which has been made as to the difficulty of assessing the value of preventive measures. In fact, the chances are in favor of any preventive measures being credited unjustly with success, on account of the frequent cessation of the disease after the first two or three cases, and if the plan were adopted of dealing with every carcass as if it were known that the animal had died with anthrax, serious losses from the disease would become even more exceptional than they are now.

It will not be denied that in the adoption of preventive measures, it is better to do too much than too little and after removing animals from the place where the disease began it will be well to give antiseptics with the view of rendering the system an unfavorable soil for the growth of the microbe,

Some years ago a common remedy was the hyposulphite of soda, which checks fermentation and is harmless and tasteless as well as soluble; easily, therefore, given in the drinking water. It will only be necessary to mix once or twice a day a sufficient quantity to allow every head of cattle to get four ounces per day. A fourth of the quantity for sheep or pigs will be sufficient, and the remedy may be used daily for a week or more without risk or injury.

Carbolic acid is more active as an antiseptic, and cannot be used so freely. A thoroughly practical man has stated that for abortion in cows he gave the remedy in a mash, mixing ¼ of an ounce of ordinary carbolic acid with the hot water with which he made the mash, gradually increasing the quantity of the acid until it reached ½ ounce, which was the largest dose the cows would take in their food. This plan is perhaps the most easy for giving the agent. I should however advise a dose of 1 dr. of the acid, gradually increased to 2 drs.; a fourth of the quantity being given to sheep and pigs, and continued daily for a week.

Durhams and Shorthorns.

A Vermont subscriber asks whether Durhams and Shorthorns are identical, or constitute two distinct breeds. Durham is a local, or provincial name for what are known in the books and markets as Shorthorns. There is a well recognized breed of hornless cattle known as Polled Durhams. These cattle have all the characteristics of the regular Shorthorns except the horns.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

A CHECK TO FRAUD AND DISHONESTY.

No law in recent times has so effectively proven its necessity and beneficence as that one enacted eighteen months ago, for the purpose of taxing the fraud out of oleomargarine. The millionaire manufacturers of oleo contended that they were engaged in a legitimate business, catering to the wants of the laboring people of the United States, by furnishing them a cheap and healthful substitute for butter; that there was no fraud or dishonesty in their transactions; that the consumer was fully advised of the character of the product, and greatly preferred it to ordinary butter. On the other hand, dairymen and dealers in butter, and great numbers of butter consumers, represented to Congress that the larger proportion of oleo manufactured in this country was palmed off upon the ultimate consumer as the genuine product of the dairy, and at a price out of all proportion to its cost; that it was of no benefit to the wage earner or any other ultimate consumer, but that the enormous profits connected with its manufacture and sale were about equally divided between the manufacturers and the dishonest dealers, grocers and the proprietors of hotels, eating houses and lunch counters.

The law taxing colored oleomargarine 10c. a pound, went into effect July 1, 1902, and Secretary Knight, of the National Dairy Union, has tabulated the effect of this law upon the production and consumption of oleomargarine for the twelve months ending June 30, 1903. The figures show the following astounding, significant and satisfactory results:

	Pounds.
Oleo made during the year, ending June 30, 1902	126,315,427
Oleo made during the year, ending June 30, 1903	71,211,244
Decrease in one year under the 10c tax	55,104,183

The decrease in the production of oleomargarine for twelve months was therefore 44% of the out-put for the preceding year; but this tells only a part of the story. Of the 71,000,000 pounds of oleomargarine produced during the year ending June 30, 1903, there were 68,490,800 pounds reported as uncolored, leaving less than 3,000,000 pounds made and sold in the semblance of butter. The uncolored oleomargarine, deprived of all pretense that it was butter, had to be sold for what it was, and at a price fairly well proportioned to the cost of production and distribution. At a very moderate estimate, this was a saving to the ultimate consumers of from 6 to 10c. per pound, or somewhere between $4,000,000 and $6,800,000. This sum, therefore, represents the savings to the laboring men of the country in the one item of purchasing a substitute for butter, and, of itself, fully justifies the enactment of the law by Congress.

It follows, of necessity, that the withdrawal of 55,000,000 pounds of oleomar- has increased the demand for butter, and notwithstanding the largely increased make, has added an average of 1½c per pound to the wholesale price of butter, or say, $3.75 to the annual income from every dairy cow, under free and honest competetition; and free and honest competition is all that the dairymen of the country have ever asked for or have any right to expect.

In the nature of the case, it has been impossible during the first year of the law, to impose and collect the tax of 10c a pound upon all colored oleomargarine, and there is, therefore, every reason to expect that the current year will show a much larger decrease in the consumption of the colored product, and a still larger demand for genuine butter.

ALFALFA NOTES FROM THE HOARD'S DAIRYMAN FARM.

Last spring we commenced feeding alfalfa hay to the work horses, three teams, on the HOARD'S DAIRYMAN farm. These horses had a large amount of work to do in the way of plowing and planting over 50 acres of corn, 15 acres of barley and about the same amount of oats, as well as other miscellaneous work. They have also worked at the cultivation of the corn and have done their share of the work in the harvesting of two crops of alfalfa on 32 acres. We have watched with considerable interest the effect of the feeding of alfalfa to these horses. The grain ration was early cut down to about half of what we usually feed, and we find that these horses have kept in finer condition than ever before. They are inordinately fond of the alfalfa, eating up the coarse stalks to the last vestige and their mangers are emptied very quickly. Care is taken not to give them all they will eat as they will gorge themselves on it if allowed so to do.

We believe it to be the most valuable hay that can be had for farm horses and all working teams.

A few weeks since we commenced feeding the cows alfalfa hay night and morning while they were in the stable for milking. Although they run on a very flush blue grass pasture, the cows take hold of the alfalfa hay eagerly, and there has been a noticeable gain in the milk, even in cows that have been giving milk for 9 months. The more we feed and study this plant the more are we astonished that farmers in the northern and eastern states had not taken hold of it and studied out how to raise it years ago. We mentioned quite briefly, a few weeks since, the fact of our wintering nine brood sows from last November to April first on alfalfa hay alone and their drink, the latter consisting of water and what little skim milk was left after feeding a large stock of calves. We did this in the belief that such food would show in the character of the pigs. In this we were not disappointed, for we never before had as good success in the farrowing season. The nine sows brought us 78 pigs and 75 are living today and thriving finely. They get fresh mown alfalfa twice and three times a day with skim milk, middlings and soaked corn. In the lot are 35 sows, which we will keep, over for breeding purposes, wintering them as we did their mothers, on alfalfa hay. We estimate that the feed cost of wintering a full grown sow weighing 200 pounds in this way, will not exceed a dollar and a half. This becomes a very important item in the cost of making pork and particularly so, in view of the almost certain prospect of a short crop of corn. We have never found any combination for producing milk that will equal in cheapness and efficiency corn silage and good alfalfa hay. Farmers who have tried alfalfa with poor success should not get discouraged. It is too valuable a forage plant to give up without a long and thorough trial. Let us remember that almost every degree of latitude has to be worked out to methods that belong to that climate. The present sea- in Wisconsin has been very wet, and the finest success has been had on the highest ground, if the land was fertile enough to give the plants ample support. We have found nothing in the way of a fertilizer that equals wood ashes. The plant is very fond of potash and we believe alfalfa growers in the middle west, as well as in the east, will find it very profitable to give their alfalfa fields a dressing at least once a year, either of sulphate or muriate of potash if they can not obtain the carbonate in the form of wood ashes. The season has been an exceedingly trying one in which to make alfalfa hay yet we have suceeded very well through the use of cotton cloth hay caps. There is a marked difference in the quality of the hay cured in cocks from that cured in the hot sun in windrows as farmers usually cure their hay. But every grower should always remember to move the cocks a few feet on to fresh ground every 48 hours else the alfalfa under them will be badly smothered. It pays to take a great deal of pains in the growing of alfalfa and the making of the hay as the following analyses will show.

Wheat bran analyzes in digestible protein					12.6 per ct
Alfalfa	"	"	"	"	11 per ct
Red clover	"	"	"	"	6 8 per ct
Timothy	"	"	"	"	2.8 per ct

The above analyses shows why our horses needed so little grain when fed on alfalfa. It also shows how tremendously mistaken a great many people are in their estimate of the value of timothy hay. As will be seen, alfalfa in good condition is within one per cent as rich a food as wheat bran.

There is a splendid field here for the intelligent dairy farmer to conquer, and it will pay him a hundred fold to read and post himself all he can in this matter.

About Tests.

There is, and there always will be, more or less disappointment and complaint possible from patrons about the test of their milk at the creamery or cheese factory. Sometimes, there may be abundant cause for complaint, for buttermakers and cheesemakers, even with the best intentions, may sometimes make mistakes, and we regret to say, that there may be buttermakers and cheesemakers who do not always have the best intentions.

But, even under the most favorable conditions, tests will vary, and, more often than otherwise perhaps, no sufficient explanation can be given for this variation. A Minnesota buttermaker, Mr. B. B. Scripture, of the Pleasant Valley Creamery, writes to *The Dairy Record* on this subject as follows:

At the end of each month we are asked many times: "What is the matter with my test?" It is several points lower than last month.

They should ask themselves this question: What have I done to lower my test?

I will mention a few of the things that will make the test vary.

Sometimes the whole herd is excited by some unusual noise, or possibly the dog was sent after them at milking time. Or, it may be they came in contact with the hard side of the milking stool. These things will lower your test every time.

Treat your cows kindly and induce them to come up at milking time of their own free will; it is a good plan to give them a handful of feed each time they come in the barn. They will soon learn that you are their friend, and they will pay you well for your extra trouble.

Sometimes we forget, when we are in a hurry, that the last part of the milk is the richest in butter fat. It also has a tendency to dry your cows up when not milked dry. Milk regularly, feed and water as near the same time each day as possible; keep your cows comfortable every day in the year; all these things will increase the flow of milk, and have a tendency to raise your test.

Sometimes we haul milk to the factory in large cans, and to prevent the milk from slopping out, a cloth is used between the cans and milk, and by the time it reaches the factory the cloth is saturated with cream.

During warm weather and when the roads are rough the cans that are not full, are so badly churned when they reach the factory it is impossible to get a fair sample of the milk; always fill your cans full. In the winter some of us forget to cover our cans and find when we reach the factory that the cream is frozen into the bottoms of the covers. We pour in the remainder of the milk and then ask the buttermaker: "What makes my test drop off so sudden."

The last point that I will mention, but not least, and possibly some of us never thought about is, part of the year we may be milking cows that are very poor testers, and the rest of the year the majority of them may be extra good cows and still give a good flow of milk.

The cows of Minnesota average about 150 pounds of butter per year, scarcely enough to pay for the feed. Where does the profit come in? I think it is time that we brace up and get out of that old rut that our fathers have been in for years.

Some will say how are we to know our poor cows from our best ones. My advice to you is this: Talk the matter over with your buttermaker and tell him how you are situated, and ask him if he will test your herd, providing you weigh and sample each cow's milk at each milking for seven days; after this is done it will be quite easy to decide which are the profitable cows, and if you continue to do this for several years and sell your poor cows and raise your heifers from your best cow, you will soon have a herd that will make you a good profit, and one that any dairy farmer can well feel proud of.

Feeding Dairy Cows.

Speltz, Barley and Corn Compared.

Part II of Bulletin 81 (June, 1903), of the South Dakota Agricultural Experiment Station, reports some experiments in feeding dairy cows. Fifteen cows of the college herd were divided into three lots of five each, and after the preliminary feeding period of about two weeks, lot 1 was fed ensilage and grain for 27 days; lot 2, bromus inermis hay and grain, and lot 3, alfalfa and grain. After another interval of about two weeks, lot 1 was fed hay, ensilage and speltz; lot 2, hay, ensilage and corn, and lot 3, hay, ensilage and barley, and in the third period, lot 1 received barley in the place of speltz, lot 2 speltz in place of corn, and lot three corn in place of barley.

We do not think these short feeding periods, with an interval of two weeks between changes, are very conclusive, and much less conclusive when the cows were fed as these cows were, first, all the grain they would eat, and after that, whatever hay and ensilage they would consume, taking back and weighing whatever was refused. Such feeding as this, without a chemical analysis of the excrement, is really no fair test of the cows or of the feed. For in almost every case, and especially in this South Dakota experiment, the internal evidence points very strongly to a lot of matter passing through the cows undigested. The time has come, we think, when our experiment stations should be altogether more particular and complete in conducting and reporting their experiments.

Following is the summary of conclusions drawn by the authors from their experiments:

1. Ensilage is more palatable than either alfalfa or bromus inermis hay.

2 It required less grain to produce a pound of butter fat when ensilage was fed as the sole roughage ration than with any other lot.

3. By feeding all of the ensilage the

cows would eat, a pound of butter fat was produced cheaper than with either alfalfa or bromus inermis hay.

4. Bromus inermis hay, when fed in conjunction with the same kind of a grain ration as was the alfalfa hay, produced a pound of butter fat one and sixty-one hundredths cents cheaper, and twenty-seven hundredths cents more than the lot receiving ensilage.

5. A change from a succulent to a dry feed is not advisable. as the loss in the quantity of butter fat and in the weight of the cows was greater than with the changes that were made in the lots getting the hays.

6. It required two pounds more of speltz to produce a pound of butter fat than it did barley or corn under the same conditions.

7. The per cent of butter fat is governed by the breed and not by the feed.

8. Fresh cows produced a pound of butter fat with less grain than did those that were further advanced in the period of lactation.

9. During periods B and C it required one-third more grain to produce a pound of butter fat with the beef-bred cows than it did with the dairy-bred cows.

Cream and Cream Testing.

ED. HOARD'S DAIRYMAN:—Several in this vicinity have been using hand separators and taking the cream to factory. The factory insists on having 25% to 35% cream. They test our cream with the same pipette used for milk. I brought my cream down to 20% and got about ⅓ more money, but they refuse to take my cream unless I raise the test. They claim they would be losers on cream under 25%. If you will kindly settle this question you will be doing a great favor to a number of men who want only what is right.

Kilbourn, Wis. E. F. G.

It is all right for a factory to insist on having cream that will test 25% fat or more, but it is all wrong to take the samples with a pipette of any kind. Moreover it is contrary to the law in Wisconsin to use a pipette for this purpose, and if the factory mentioned does not stop this practice right away the Dairy and Food Commissioner of the state will see that they are prosecuted and fined for disregarding the law.

When cream is properly tested and correct samples are taken it will make no difference to the patron whether he makes cream testing 40% fat or 20%.

Pennsylvania Pickings.

ED. HOARD'S DAIRYMAN:—Some times I have to go away from home. It is a great hardship and nuisance for a thoroughbred countryman to have to ride in cars and move and have his being in cities in summer time. Such a tribulation was mine last week. My car ride was through one of the most progressive agricultural sections in the state, and that means in the nation, and making a virtue of necessity, I composed myself for some observations upon farming conditions.

One of my special views was as to the condition of pastures for cows. The section is notably a dairy section. I contend that a dairy cow on pasture at this season of the year simply cannot secure a full feed. In the spring when grass is abundant, growing, and abounding with life and life elements, it is possible for a cow to meet her food demands with no more expenditure of energy than she may enjoy as wholesome exercise. But as the grass ages with the advancing season, becoming both scarcer and less digestible, with the heat of the sun and the discomfort of pestiferous flies, her securing enough nourishment to supply the needs of her animal economy, with sufficient surplus to maintain an uninterrupted milk flow, becomes very doubtful, if not impossible, so that as a safeguard against an inevitable shrinkage of milk at this season of the year, the cow must be supplied in comfort at the stable with the food lacking at pasture.

On this ride I knew I would see many herds at pasture and my thought was to see if such a pasture as would give reasonable assurance of supplying the cow's needs could be seen. I knew I wouldn't see such and I didn't. No doubt, many of the herds were liberally fed on commercial feeds in addition to the scant pasturage, but I saw very little evidence of any provision having been made to cut down the necessity of the boughten feed by the growing of soiling crops.

Transforming a Barnyard.

The above cuts show the comparison between a dirty, ill kept yard where the cows stand knee-deep in mud and manure, and one that has been put in proper shape. A dairyman may produce dirty milk amid clean surroundings, but he certainly cannot make clean milk with dirty surroundings, and clean milk has an increased cash value over the unclean article. The cuts are from the Illinois Experiment Station Report.

COMMERCIAL AND OTHER FEEDS.

The best profits must come to the general dairyman by his producing as far as possible the food his animals need. I think it will be found profitable, under all ordinary circumstances at least, for him to supplement his home products with the purchased ones, but the latter should always be the help and never the dependence. And while I am a strenuous advocate of liberal feeding of cows, even when on good pasture, I very much doubt if one may do it profitably by the extensive use of commercial feeds, by reason of the fact that at pasture one may not save all the manure to apply where it will do the most good.

THE SOIL'S SHARE.

Our most careful eastern farmers are coming more and more to have regard for the proper treatment of their soils, and to recognize the fact that animal husbandry must have a secure place in our agricultural economy. It is an easy matter by the extravagant use of commercial fertilizers to sink in them the small profit of a medium crop. It is quite as easy also to absorb a dairy profit by too heavy feeding of boughten feeds even to pretty good cows; while feeding any kind of feeds to poor cows can mean nothing but loss.

Certainly, therefore, where proper consideration is given to the maintenace of the land's productivity a moderate use of commercial feeds given to profitable animals, from which the excrement is all saved and immediately applied to the land, is in the line of wise farming. And in our eastern farming a judicious and intelligent use of commercial manure in connection with the farm animal wastes will more than pay their cost.

AN EXCEPTION.

At the end of this journey I have mentioned was the farm of my friend who keeps two cows to the acre, buying only the concentrated part of their rations and saving all the manure with the jealous care of a man who fully appreciates its value and necessity for his farming.

He uses no commercial manure, nor does he need to, but he with his method, which is after all only a concrete application of advanced science to farming, is conspicuous and alone in his achievement.

OATS.

Our oat harvest in this part of the world was remarkable. We grew fine heavy straw, which in many fields rusted badly; and when we came to harvest the crop it was found the grain had not developed—nothing but husks It was generally mown and raked up as hay; and some farmers who bale and sell their oat straw will bale this crop without threshing. W. F. MCSPARRAN.

Pennsylvania.

Pink Eye and Milk Flow.

ED. HOARD'S DAIRYMAN:—Enclosed find communication from Dr. Roberts, which is self explanatory.

The local physician advised that inasmuch as young stock affected recover in due time, without treatment, it would only be needful to treat milch cows. Said he thought he could shorten the period of its duration about one-half. One man had two cows, another has six affected.

The disease checks the flow of milk quickly, and it is doubtful if they will be profitable milkers until fresh again.

The time is comparatively short until the stock will all be brought to the barns, and then I fear there will be trouble, if nothing more is done than recommended. The disease is undoubtedly pink eye, and contagious. MRS. L. ELLIS.

Chippwa Falls, Wis.

The symptons you describe are those of a disease commonly called pink eye. While it is contagious, it is very seldom fatal, and if properly treated, seldom leaves the animal blind.

I would advise you to call in a qualified veterinrian, as this disease does not come under my jurisdiction. E. D. ROBERTS.

Janesville, Wis.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Fat in Milk and Yield of Cheese.

I am sending you exact copies of my cheese factory statements for May 1902 and 1903. Will you please explain why with a 4.7 test it takes more milk for a pound of cheese than it did last year with a 4.2 test? How many pounds of butter would the 4.7 test give me and what would it have to bring a pound to make it as profitable as cheese? A skimming station near here allows an overrun of 3%. Is this the general allowance? What is oil meal worth a ton in comparison with wheat bran? I only sent 3 cows in May this year, one a two-year-old heifer. Your paper is O. K.

1902.

Amount of milk May	1826
Test	4.2
Pounds cheese made	199

1903.

Milk furnished in May	2360
Test	4.7
Pounds cheese made	250

Wolcott, N. Y. D. W.

Surely, this inquirer did not expect that we could explain why milk testing 4.7% fat should yield less cheese than milk testing only 4.2% fat. The inquiry would have to be proposed and the investigation made much nearer to the factory. Several reasons might be assigned and yet the real reason not stated. Possibly, the milk did not work as well this year as last year. Possibly, the condition of the pastures may have accounted for the decreased yield. It was noted during a severe drought in Wisconsin a few years ago, that milk contained a very appreciable amount less casein than common. It may have been that some of the patrons brought gassy milk, which mixed with the other milk, not only made gassy curd, but caused an appreciable quantity, both of the fat and the casein, to run off in the whey.

One hundred pounds of milk testing 4.7% fat, manipulated under the best possible conditions, separator and churn wasting only the minimum amount of fat in the skim milk and the butter milk, might yield 5.48 pounds of butter. This butter would have to sell for 20.3 cents per pound to equal the yield of cheese reported which sold at 10½ cents per pound.

The overrun in manufacturing butter at a creamery varies from 12 to 16%. In other words, the amount of butter will be from ⅛ to ⅙ more than the total fat in the milk.

Oil meal contains 78% of digestible units and bran 58%. But oil meal, in addition to its nutritive properties, has certain dietetic effects that cannot be well estimated. Perhaps as accurate an estimate as could well be made, would be to say that oil meal is worth at least 50% more than bran.

Tar Paper Lining for Stable Floors.

On page 417 of DAIRYMAN the editor states that he used tarred paper for lining stable floor. Did he place the paper below the plank floor, and did it prevent the moisture from passing through? Would it make the floor over basement stable sufficiently tight to keep stock on it? C. H. G.
Mauston, Wis.

A more careful reading of the article on page 417 shows that common tar paper was not recommended, either for lining silos or stable floors, but a special quality of building paper manufactured by the Standard Paint Co., 100 Williams St., New York City. The common tar paper is very quickly rotted by the acids in silos and stables, whereas, the paper referred to is comparatively, if not completely, acid proof.

In lining his stable floor, the Senior editor laid down a double floor, placing this special quality of paper between the planks, and has had no trouble with liquids going through.

Ration for a South Carolina Cow.

Will you do me the favor to give me a balanced ration for my Jersey cow? She is of the lean milk producing build and puts her feed into milk. She is a hotel cow and the object in view is to increase the flow of her milk and not to sell it for profit. She weighs about 850 pounds. Feed stuffs here cost as follows: Corn meal 90 cents bu.; wheat bran $1.25 per 100 lbs.; cotton seed meal, $1.40 per 100 lbs.; cotton seed hulls, 45 cents per 100 lbs.; baled hay, $1.10 per cwt.; country hay, 75 cents per cwt. My cow has no pasturage or green stuff at all. The country hay is not as nutritious as your northern hay and its true feeding value is probably very small. Its chiefly crab grass; no clover nor anything like that. I will certainly appreciate the information. W. L. B.
Gaffney, S. C.

Crab grass hay, if cut at proper season and properly cured, should have a higher feeding value than the ordinary run of baled hay shipped from the north, but it is pretty hard lines to condemn a cow to a constant diet of dry hay, no matter how good, and grain. If to be had at any reasonable cost, we recommend this inquirer to procure some linseed oil meal and feed from one to two pounds per day. This will have a tendency to correct the bad effects of a constant diet upon hay and cotton seed products. In connection with this linseed oil meal, one might feed two pounds of cotton seed meal and four pounds of good wheat bran, with hay *ad libitum*. If it should be deemed expedient to feed a larger allowance of grain, add in the proportions above given, and with every mess of grain, feed a large teaspoonful of salt. An occasional "bran mash" would be a welcome relief from the terrible monotony of constant dry feed. Possibly, our correspondent may not understand what is meant by the term "bran mash." This is simply scalded bran well seasoned with salt, but not made into a thin slop.

Hop Clover.

I inclose you sample of grass. Seems to grow something like white clover. I find it spreading in my pasture, especially on the hill side.
Cairo, Ill. N. B. T.

As near as can be determined without the blossom, the sample sent is hop clover, or Trifolium Agrarium. We do not know as this ever becomes a pernicious weed, as the clovers usually die out after a while, and this plant probably has the same habit.

Effect of Plowing Under Rye.

If you sow rye where you have cut a crop of corn this fall and plow it under in the spring, other things being equal, could we expect a good crop of silage, and do you use fertilizers in your practice, and what amount per acre?
Norwich, Vermont. R. C. & SONS.

The plowing under in the spring of rye, sown the previous fall, has proven very advantageous with us, not that this has added any fertility to the soil, as plowing under clover or other leguminous crops which gather nitrogen from the air would have, because in the case of the rye, there was nothing plowed under that did not come from the soil. But the plowing under of this rye does add very materially to the amount of humus in the soil and greatly improves its texture—in both respects, adding very materially to its drought resisting qualities and probably dissolving out and rendering more available some of the mineral constituents already in the soil.

Ensilage Corn Too Thick.

Will ensilage corn, three to seven feet high, be of any use to feed cows for milk? My plan is to drive a narrow one-horse sled between the rows and pull out the surplus corn and feed it to the cows. The drill was set to drop eight inches apart, but very often two grains dropped instead of one. What distance apart should the stalks be? It is Virginia ensilage and grows from 12 to 16 feet high in this section. Will feed a little gluten feed anyway. G. P.
Ohio.

This immature corn will of course have some feeding value, but if the pastures are as luxuriant in Ohio as they are in Wisconsin at the present time, there will be very slight demand for forage of this kind. In ordinary years, we would not

"ADVERTISEMENT".

WON'T MIX.

Bad Food and Good Health Won't Mix.

The human stomach stands much abuse, but it won't return good health if you give it bad food.

If you feed right you will feel right, for proper food and a good mind is the sure road to health. "A year ago I became much alarmed about my health for I began to suffer after each meal, no matter how little I ate," says a Denver woman. "I lost my appetite and the very thought of food grew distasteful, with the result that I was not nourished and got weak and thin. My home cares were very heavy for beside a large family of my own I have also to look out for an aged mother. There was no one to shoulder my household burdens and come what might I must bear them and this thought nearly drove me frantic when I realized that my health was breaking down.

I read an article in the paper about someone with trouble just like mine being cured on the food Grape-Nuts and acting on this suggestion I gave Grape-Nuts a trial. The first dish of this delicious food told me I had struck the right thing. My uncomfortable feelings in stomach and brain disappeared as if by magic and in an incredibly short space of time I was again myself. Since then I have gained 12 pounds in weight through a summer of hard work and realize I am a very different woman, all due to the splendid food Grape Nuts." Name given by Postum Co., Battle Creek, Mich.

Trial will prove.

THE U. S EXCELS ON ANY TEMPERATURE.

Our "would-be competitors" the DeLaval Separator Co., finding themselves badly beaten in the six weeks' tests of six different makes of Separators at the Kansas Agricultural College, as shown by the official Bulletin No. 123 issued May 26, 1903, in their efforts to break the force of so disastrous a defeat, have compiled a Bulletin of their own "getting up" purporting to be signed by several students, in which they try to make it appear that the DeLaval was not terribly beaten, as the Official Bulletin shows it was as follows:

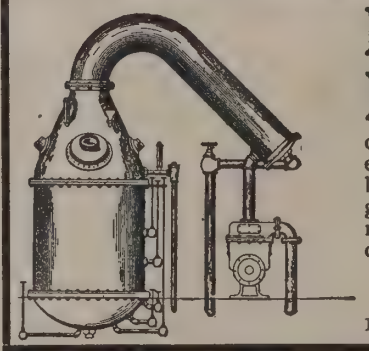
Average test of skimmilk of DeLaval Separator	**.048**
" " " U. S. "	**.033**
U. S. excels DeLaval	**.015**

Showing that the DeLaval Separator left 45 per cent. more butter fat in the skimmed milk than the United States.

Again in this "gotten up" Bulletin, our "would-be competitors" state that the U. S. Separator "choked up" on 39 lbs. of milk at 70 degrees of temperature and that the DeLaval ran 80 lbs. Every dairyman using a U. S. Separator knows that the U. S. will not "choke up" on 80 lbs. of good milk at 70 degrees, and that such statements are made in an attempt to break the rapidly gaining popularity of the

U. S. SEPARATOR.

We make the following proposition to any dairyman wishing to buy a separator, viz.: We will put a U. S. Separator into his dairy and agree that it will not "choke up" on 80 lbs. or twice 80 lbs. of milk in good condition at 70 degrees, provided he will pay for the separator if it does not "choke up."



The best authorities do not advocate separating at 70 degrees, but if Dairymen prefer to, the U. S. will do it when properly adjusted.

The U. S. Separator skims cleaner than any other separator on the market at any temperature from 70 degrees to 156 degrees at proper adjustment. The Official Bulletin No. 123 of Kansas Agricultural College, dated May 26, 1903, states that

The U. S. Excelled all Others in tests of Skimmed Milk and in Minimum Total Loss.

THE U. S. SEPARATOR HOLDS WORLD'S RECORD.

hesitate to say that it would have very considerable value, but it may be a question, whether for this year, it would not be better to let the corn stand and harvest it for silage.

Quack Grass.

Quack grass is getting to be a farm pest, for its manner of growth and tenacity of life makes it exceedingly difficult to kill. The following method of eradication is given by Mr. F. Henry, in *Northwestern Farmer*.

Quack or twicth grass, is getting a strong hold all over the Northwest. Very few localities are free from it and a great many farms are getting over-run with it. While I should be very careful not to let it get a foothold on a farm that is clean, I should not be discouraged if I had it to contend with. Now I do not mean to say that if you have it in any considerable quantites that you will ever be likely to get entirely rid of it, for I never saw a field of any considerable extent, entirely cleared from it. I do know, however, that it can be so handled and kept in check, that good crops can be raised continually. The question on farms that have it to contend with is, how can it be dealt with so as to keep it in check. If a field was well taken with it, I should plow it quite shallow, as soon as the grain crop could be removed and harrow it down as smoothly as possible. At this season of the year the ground is usually quite dry. If the work is well done, a great many of the roots will be destroyed. I should plow it again quite deeply just before it froze up. By turning the roots to the surface at that time, when the weather is too cold for them to start, a great many more will be killed by the frosts of winter. As soon as the weather warms up in the spring and the ground gets in good condition to cultivate, I should work it up thoroughly, and keep it up at least once a week, until it is time to plant either corn or potatoes. I should prefer potatoes, as I want to keep it to hoed crops for two years, and I do not want to follow corn with corn. By keeping the crop thoroughly cultivated, you will not only get a very good crop of corn or potatoes, but will have the quack pretty well under control by autumn.

The dryer the season the more thoroughly you can do the work. About all the quack you will see in the fall will be in the potato row and if they are dug with a machine the roots will be sifted to the top in digging and very little will be left to contend with the following season. Now I should treat the quack just as I should any other enemy in battle; follow up the first victory and put the enemy to a total rout. I should plow the field again as late as possible after the potatoes were dug and begin the next spring as the season previous by starting the cultivator as soon as the soil worked good and keeping it up at close intervals until corn planting time. I should cultivate the corn very thoroughly and by the end of this second season I would have the quack so thoroughly subdued that it would be in fine shape for a crop of small grain. I should prefer to sow wheat or barley as oats would be likely to lodge badly. To make a good job, still better would be to seed it down to clover and if a good catch was secured the following year the clover would smother out what little would remain after two years of cultivated crops, for nothing can grow under a dense shade of clover. I have seen a field of quack well subdued in one season by keeping the ground thoroughly worked until the middle of June and then sowing to buckwheat. The buckwheat so thoroughly shades the ground as to smother the quack. It will not do, however, to follow buckwheat with corn.

ROTATE.

If a farm that has quack is rotated with potatoes, corn and clover and only an occasional small grain crop sowed and that as a nurse crop with the clover and thorough cultivation practiced, not much trouble will be experienced with quack grass, and the extra cultivation that the soil gets to eradicate the quack, will serve to liberate plant food and insure big crops every year, even if the year is not the most favorable. Do not try to handle too large a field of quack at a time. Take what you can handle properly and work it thoroughly and you will succeed. Take twice what you can work well and you will fail and want to sell out and move west. What you cannot handle properly put into pasture until the time comes when you can handle it. It is not apt to get worse by pasturing it, and it yields most excellent feed. I have noticed in my pasture that the stock keep it eaten very closely where other grasses are passed over by the stock, and allowed to go to seed.

Getting Silage Out of a Pit Silo.

ED. HOARD'S DAIRYMAN:—I am sorry that in making my inquiry as to getting silage out of a pit silo I failed to give enough information. The silo is 24 ft. wide and thirty ft. deep. There will be from 40 to 60 cows in the barn, and the calculations are to feed 15 pounds twice daily or from 20 to 25 pounds once daily. This means that 600 pounds is the least we will want at any one feed, and the probabilities are that we will want nearly a thousand pounds at a feed. In this case the use of a team is easily arranged as we always have a team near the silo at that time of day. If you know of any practical method to be used in this case, we would be glad to hear through the colums of the DAIRYMAN.

Of course I know this letter is too long to print in full, but I wanted to make sure you understood the situation, so you could "boil it down." W. N. B.

Fort Calhoun, Neb.

A silo 30 feet in the ground presents more than one serious problem. In the first place, it should not be forgotten that there is more or less danger of the accumulation of carbon dioxide, and one should not go down in such a pit without taking some precaution to stir up the air and thus facilitate the escape of this deadly gas. This can be done by lowering the boxes or baskets used for elevating the silage into the pit and drawing them up rapidly two or three times.

Probably, the most successful way for elevating this silage would be to purchase and rig up one of the litter carriers which are advertised in our columns and arrange with a set of pulleys and a windlass for lowering and elevating the same and transferring it to an overhead track leading into the feeding alleys. We should much prefer the use of a windlass for this purpose rather than to be under the necessity of using a team. One might use, in place of the litter carrier, some two bushel baskets which could be lowered into the pit, there filled and drawn up over a single pulley and then carried by hand into the feeding alley.

"ADVERTISEMENT."

ABOUT COMPLEXIONS

Food Makes Them Good or Bad.

Saturate the human body with strong coffee and it will in time show in the complexion of the coffee drinker.

This is caused by the action of coffee on the liver, thus throwing part of the bile into the blood. Coffee complexions are sallow and muddy and will stay that way until coffee is given up entirely.

The sure way to recover rosy cheeks and red lips is to quit coffee and drink Postum Food coffee which makes red blood. "I had been for more than 20 years an inveterate coffee drinker and it is absolutely true that I had so completely saturated myself with this drug that my complexion toward the last became perfectly yellow and every nerve and fibre in me was affected by the drugs in coffee.

"For days at a time I had been compelled to keep to my bed on account of nervous headache and stomach trouble and medicines did not give me any relief. I had never consulted a physician in regard to my headaches and terrible complexion and I only found out the cause of them after I commenced the use of Postum which became known to me through Grape-Nuts. We all liked the food Grape-Nuts and it helped us so we thought Postum must certainly have merit and we concluded to try it. We found it so delicious that we continued the use altogether although I never expected it to help my health.

After a few months my headaches were all gone and my complexion had cleared wonderfully, then I knew that my troubles had been caused by coffee and had been cured when I left off coffee and drank Postum in its place." Name given by Postum Co., Battle Creek, Mich.

Postum will change the blood of any coffee drinker and rosy cheeks and health take the place of a yellow skin and disease.

Empire  **Empire**

Eight Years — Fifteen Cows

1895 1896 1897 1898 1899 1900 1901 1902

The Empire Way — *Makes Cows Pay.*

How's This for a Record?

Emporia, Kans., Jan. 2nd, 1903.

Empire Cream Separator Co., Bloomfield, N. J.

Dear Sirs: Have used one of your **Empire** Cream Separators for the past eight years, during which time I have been milking at all times from twelve to fifteen cows. The cost for repairs in the eight years has been only seventy-five cents. I have had experience with other separators but consider the **Empire** superior to any other, as it never caused me any bother. It is easy to clean and has proven very durable. It does good work at all times. L. H. VAHSHOLTZ, Rural Route No. 4.

The Empire Cream Separator turns more easily, is more easily cleaned, does better work, and costs less for repairs than any other, because it is the **simplest separator made.** Don't buy a separator until you have investigated the merits of the Empire.

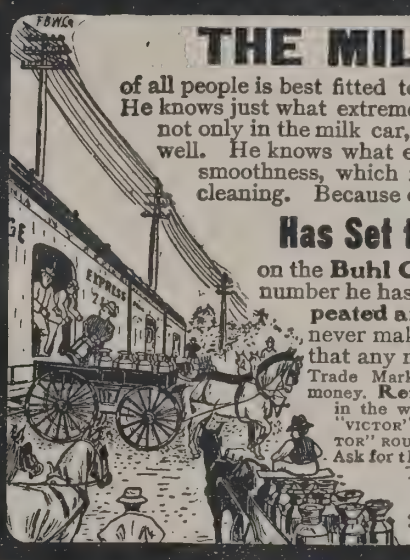
Milk Bottle Caps



These are but a few of the many things of our own superior make for the milk dealer, dairyman and creamery man. Write at once for our free illustrated catalogue.

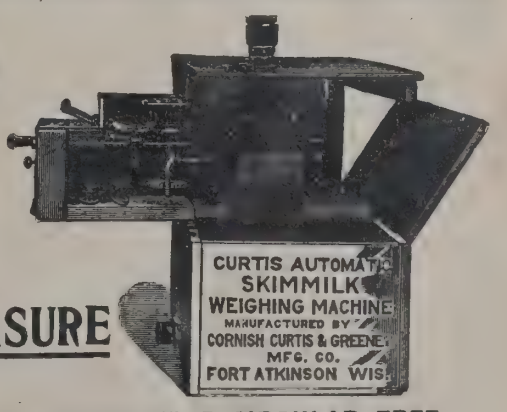
STURGES & BURN MFG. CO.
Chicago, Ill., St. Paul, Minn., Kansas City, Mo.

THE MILK SHIPPER

of all people is best fitted to judge of the merits of a milk can. He knows just what extreme hard wear a can is subjected to, not only in the milk car, but in the city delivery wagon as well. He knows what economy there is in toughness and smoothness, which mean wear, resistance and ease of cleaning. Because of this knowledge he

Has Set the Seal of His Approval

on the **Buhl Cans.** This is witnessed by the large number he has bought in the past and by his **repeated and ever increasing orders.** He never makes a mistake, because he has learned that any milk can stamped with the Milk Can Trade Mark is the best milk can for the money. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. All dealers sell them. Ask for the **Buhl.** Look for the Milk Can Trade Mark. No other Can so good.



Buhl Stamping Co.,

Ensilage Blowers and Patents.

ED. HOARD'S DAIRYMAN:—Can you tell me through columns of DAIRYMAN, whether I can rig an ordinary fan and pipe to my ensilage cutter for filling silo without buying one of the ready made machines, and not infringe on any one's patent? In other words, is the process itself, of filling by the "blow method" patented? I have a regular chain and slat carrier to my cutter and have used it to good advantage, but now in changing my power to stationary engine, I find I must have cutter stand directly at side of silo, and I want to try the tube and fan arrangement.

And, by the way, what about our friend, J. D.P.in Aug.7 number of DAIRYMAN, pages 596 and 597? Is he all there, as they say? where he tells how those cows of his neighbors were starved down to 4 cents per day; that almost hit me, and I am resolved to take the hint and feed more grain and keep the rations better balanced. I weigh my milk and use the Babcock occasionally. Hope for separator soon. J. B.

Windham Co., Conn.

We cannot say whether J. B. can "rig an ordinary fan and pipe to his ensilage cutter" so as to make it work successfully, but nothing is more certain than that a "principle" cannot be patented. Only new devices, or new combinations of old devices for accomplishing results are patentable. Therefore, the "blow method" as such is not patented.

J. D. P seems to have been "all there" and all right, so far, at least, as J. B. is concerned, and there are others who might profitably take the hint which is but thinly veiled in the communication referred to.

Cause of Spoilt Silage.

ED. HOARD'S DAIRYMAN:—In reply to D. G. S., page 576, HOARD'S DAIRYMAN, regarding his silo, would like to state in addition to reply by the editor, that those corners are probably a fatal mistake unless those 1 foot long boards are doubled and felted between till they are perfectly air tight. Again, I suspect outside water has gotten into the bottom of pit. A silo must be gas tight as well as air tight, so that the carbonic acid gas will not be allowed to escape at bottom.

My silo is 10×20ft.×25ft. deep. It is double boarded and felted between above foundation, but inside, matched boards are vertical and lap down over wall, both sills and boards imbedded in cement. I had trouble with the corners above wall and simply made a trough of six-inch boards, carefully joined and securely nailed in corners, which is entirely successful. I cover my ensilage (which is thoroughly matured glazed corn), with tar paper and barn boards, and weight with green fence posts or any other convenient weight of about two tons. The ensilage comes out good to the felt excepting one cart load from edges and corners. E. B.

Colora, Md.

CONCERNING OUR ADVERTISERS.

There is ad. in this issue of the Cuttaway Harrow Co. implements. This firm manufacture a line of implements that every reader of HOARD'S DAIRYMAN should be interested in. Write them for circulars.

One of the best mail boxes made is the Signal Box made by the Signal Mail Box Co., Joliet. Ill. They are making a proposition now that will be interesting to any one wanting a good mail box. Find their ad. in this issue and write them.

DAIRY MARKETS.
